

EDITORIAL 67

Industry can't expect to get realistic depreciation allowances until it can agree on how they should be figured.

SPECIAL FEATURE 170

Shipments of finished steel in March will reach the 7 million ton mark for the first time since June, 1957. Users' stocks by July 1 will total 21 million to 22 million tons. That's going to be a strong influence on the course of steel wage talks.

WINDOWS OF WASHINGTON 78

Speaking broadly, making 1000 Atlas missiles is equal to turning out 5000 Cadillacs, says NASA planner.

MIRRORS OF MOTORDOM 87

Welding Comes of Age

Maybe it's the sign of a warped mind to think along these lines, but when one wears a crooked hat, what else can one do? Recently Eleanor Roosevelt publicly blessed a synthetic butter called margarine, and where do you suppose that left President Dwight David Eisenhower? The Democrats had stolen a march (marcharine, that is) on the Republicans in the department of public relations, and Mr. Eisenhower was understandably concerned. To retain face, he felt compelled to bless something in a hurry.

By a remarkable coincidence, the publicity committee of the American Welding Society approached the President at that moment. They explained that welding should be recognized publicly as a prime and indispensable fabrication tool in modern industrial practice, and the hero of Normandy rose like a salmon. "By Presidential proclamation," he remarked, "April will be declared National Welded Products Month!"

From any point of view, there is no comparison between margarine and welding, and we think the President scored a definite coup over Mrs. Roosevelt in the matter of benediction. Never before in the history of welding has there been so much offered in the way of materials, equipment, and knowledge to help create a welded world. Half a century ago, practically the only stuff that could be welded was iron; and only 25 years ago engineers were wondering how to weld aluminum. Today, welding ranges from wisps of vapor from threadlike filaments of platinum welded under a magnifying glass, to the pyrotechnics attendant to the fusion of 6 in. armor plate.

April, then, will be dedicated to welded products. In a Communist dictatorship, we would be constrained to think of nothing else but welding during April—but here, if we wish, we may also think of violets, daffodils, and those ever-lovin' lilacs.

Fresh Air, Anybody?

Air pollution has plagued man ever since he substituted lungs for gills, and before that, if he had any of the ornery beginnings of man in him, he probably complained about water pollution. If he was obliged to breathe the waters of the Delaware, Chesapeake, or Biscayne Bay today, he would have real cause for complaint. Returning to polluted air, we have heard it referred to as "garbage in the sky"—a natural.

On Page 84 of this week's issue, STEEL presents an article concerning garbage in the sky. It describes what industry is

doing about air pollution and lists the prospects for tough federal legislation on the matter. Fact finders and statisticians can scare the devil out of you with their revelations about the stuff that falls each day on each square mile of industrial areas. If their findings don't shake you too much, the bacteriologists and medical sleuths can rock city dwellers with the news that the air they suck into their lungs resembles something shaken out of a vacuum cleaning bag.

Files Story Instead of Bars

When ideas for features or reports come unsolicited, the editors say that "they came in over the transom." We have an uneasy feeling that the story on Page 77 about a certain stamping plant shouldn't be associated with the term "over the transom," because it came from two inmates of South Michigan State Prison, and well, some matters call for delicate handling. Last fall an inquiry came addressed to STEEL. It was from a person temporarily secluded from society, courtesy of the State of Michigan. He wanted to know if STEEL would be interested in a story about a (you will pardon the expression, but we just can't help ourselves) captive stamping plant. He said it employed—or, rather, utilized—330 inmates, who produced such things as car plates, lockers, chairs, baskets, beds, coat racks, and road signs.

The editors expressed a mild interest, and when the story finally turned up, complete with pictures, it had been edited, processed, cleaned, censored, fumigated, and made completely acceptable to society.

If the manuscript broke out and made good, perhaps the authors may follow. It is warming to reflect that stone walls do not a prison make—although the institution in question is reputed to be the world's largest walled prison.

Coins in Free Fall

Mention of statisticians a few moments ago brings to mind the case of the curious numismatist. This old boy, Thomas Thomas (he came from Walla Walla, by the way) always tossed old coins about when he played with his collection. One day he found himself juggling a groat, a pfennig, a quetzal, and a shilling, and he began wondering. "If I toss them together," he murmured, "in how many different ways can they fall?"

3 New Safety Posters on the Proper Handling of Strong Acids

**SULFURIC
HYDROFLUORIC
NITRIC**

Here's essential information on how to handle sulfuric, hydrofluoric and nitric acids safely . . . from the people who know them best.

As the nation's leading producer of these strong acids, General Chemical now offers 3 safety posters which spell out the precautions that *must* be taken when handling sulfuric, hydrofluoric or nitric acid. The posters contain such important information as: the proper clothing to wear and the equipment to use; the use of water as a neutralizer; the importance of venting; first aid, and many other necessary precautions.

The posters are free. They are large and easy to read—17 inches wide by 22 inches long. They come

complete with metal rims, top and bottom, ready to post in a prominent position in your plant. To obtain any or all three, mail the coupon.

No Reason for Amazement

We think the headline for Market Outlook (Feb. 9, p. 107), "Buying Surge

(Please turn to Page 12)

Coolant sumps are breeding grounds for harmful bacteria. Laboratory analyses have found as many as 3 billion bacteria per ml. in emulsions that were only a few days old.

NOW, a simple, safe treatment with Elcide 75 keeps the bacteria count down and increases the useful life of standard duty soluble oil emulsions.

Bacteria Control: A new way to beat rising production costs

Many harmful types of bacteria contaminate coolant sumps and help destroy soluble oil emulsions. These bacteria first enter emulsions through the air, water, and the usual plant debris in the circulation system. They feed on the oil-water mixture until their build-up in the coolant causes odor, corrosion, and final separation of the emulsion. These microscopic organisms are costing the metalworking industry millions of dollars each year.

Now, this damage can be stopped with Elcide 75. Elcide 75 is a new bacterial inhibitor composed of two separate, but well-proven, anti-bacterial agents. One of these is related to a material that is popularly used in the exacting field of surgical practice. This powerful action controls a wider range of bacteria than the commonly used germicides now being marketed.

Elcide 75 has been carefully tested and evaluated by several large metalworking plants. Added to fresh

emulsions at the rate of one ounce per each four gallons of emulsion, plant researchers found that its double control increased emulsion life up to 5½ times longer than untreated emulsions.

Extended emulsion life starts a chain reaction of decreased production costs. Less oil concentrate is needed to do the same job. The number of man-hours required for servicing machine sump tanks and disposing of waste oil is greatly reduced. Production increases because the machines run longer between emulsion changes. Additional benefits gained from the use of Elcide 75 include reduced corrosion of tools and products, and elimination of rancid odors.

Try Elcide 75 in your plant and total up your savings. You'll be pleasantly surprised to find out just how important bacteria control is to good plant management.

CALENDAR

OF MEETINGS

Mar. 8-11, American Society of Mechanical Engineers: Gas turbine power conference and exhibit, Netherland-Hilton Hotel, Cincinnati. Society's address: 29 W. 39th St., New York 18, N. Y. Secretary: O. B. Schier.

Mar. 9-10, International Acetylene Association: Annual meeting, Roosevelt Hotel, New Orleans. Association's address: 30 E. 42nd St., New York 17, N. Y. Secretary: L. G. Matthews.

Mar. 9-10, Steel Founders' Society of America: Annual meeting, Drake Hotel, Chicago. Society's address: 606 Terminal Tower, Cleveland 13, Ohio. Executive vice president: F. Kermit Donaldson.

Mar. 9-12, American Society of Mechanical Engineers: Aviation conference, Statler-Hilton Hotel, Los Angeles. Society's address: 29 W. 39th St., New York 18, N. Y. Secretary: O. B. Schier.

Mar. 9-13, National Association of Manufacturers: Institute on industrial relations, Hollywood Beach Hotel, Hollywood, Fla. Association's address: 2 E. 48th St., New York 17, N. Y. Institute's director: Sybil Patterson.

Mar. 10, Society of American Military Engineers: Symposium on industry and defense, Penn-Sheraton Hotel, Pittsburgh. Information: Miss Mary Busch, Pittsburgh Post, Society of American Military Engineers, 925 New Federal Bldg., Pittsburgh 19, Pa.

Mar. 11-12, Instrument Society of America: Annual iron and steel conference, Pittsburgh. Information: R. E. Blackwell, Pittsburgh Section ISA, Box 1346, Pittsburgh 30, Pa.

Mar. 11-13, Pressed Metal Institute: Spring technical meeting, Pick-Congress Hotel, Chicago. Institute's address: 3673 Lee Rd., Cleveland 20, Ohio. Managing director: Harold A. Daschner.

Mar. 16-18, Society of Automotive Engineers: National passenger car, body, and materials meeting, Sheraton-Cadillac Hotel, Detroit. Society's address: 485 Lexington Ave., New York 17, N. Y. Secretary: John A. C. Warner.

Mar. 16-20, American Institute of Chemical Engineers: Winter meeting, Chalfont-Haddon Hall, Atlantic City, N. J. Institute's address: 25 W. 45th St., New York 36, N. Y. Secretary: F. J. Van Antwerpen.

Mar. 16-20, National Association of Corrosion Engineers: Annual conference and exhibit, Sherman Hotel, Chicago. Association's address: 1061 M&M Bldg., Houston 2, Tex. Secretary: T. J. Hull.

Complete DRILLING

versatility

for the
"cumbersome" parts...
with U. S. DRILL HEADS

Is your drilling *accurate and economical* in structural steel, tube sheets, flue sheets, and other large, cumbersome parts? It will pay you to check into a U. S. Drill Head installation on your radial drill!

Style U Universal Joint Adjustable Heads equipped with Air Counterbalance and 360° Ball Bearing Swivel Attachment give added versatility to any radial drill. Quick setup with positive lock of swivel in aligned position. Fast and accurate operation with minimum operator fatigue.

Select the *right* head for your jobs from the many sizes of Style U Heads. You'll get lots of cost-reducing features.

- ☐ Full ball bearing mounting of shafts
- ☐ Shaved gears throughout
- ☐ Exclusive quick-change neoprene-sealed universal joints
- ☐ Heavy duty spindle assemblies
- ☐ Adjustable-arm spindle mounts, or special bored Slip Spindle Plates
- ☐ Oil-tight, high-strength cast housings

Write for descriptive literature, or ask for recommendations on your particular multiple drilling problems.

Adjustable and Fixed Center Multiple Drilling Heads.
Individual Lead Screw Multiple Tapping Heads.

BEARING TIPS

by McGill

McGILL sealed GUIDEROL[®] bearings preserve high capacity performance of needle bearing applications

Lip type contact seals built into GUIDEROL bearings insure longer life for their high capacity performance in limited radial space. It's simpler and less costly to apply these sealed bearings than build in auxiliary seals that increase bearing width and housing requirements.

GUIDEROL bearings, including the sealed series, are precision built and combine the inherent high capacity of full complement roller bearings with the control of center guided rollers. This recommends the bearing for applications too heavily loaded for retainer type bearings, but where shaft deflection and misalignment prevents the use of ordinary full type roller bearings.

Seals keep contamination out and lubrication in. This assures trouble free performance where maintenance is costly or impractical.

Sealed GUIDEROL minimizes torque in ACF "Piggy-Back" trailer hitch

McGILL Sealed GUIDEROL bearings meet the requirements of a high capacity needle bearing for small radial space, having adequate seals to prevent entry of foreign materials and loss of lubricant in this exposed application. The bearings, in the elevating arms, minimize the amount of torque required to elevate the trailer hitch and jack the trailer off the car floor. The hitch, manufactured by American Car and Foundry Division of ACF Industries Incorporated, is a tiedown and cushioning unit for semi-truck trailers on flat car (Piggy-back) use. Although speeds are low, loads are as high as 20,000 lbs. per bearing. Grease relubrication when desired is applied through the shaft to the inner race of the bearing.

"Trouble-free" performance of automatic pinsetter called for Sealed GUIDEROL bearings

Prelubricated and Sealed GUIDEROL bearings are used in two applications in BRUNSWICK AUTOMATIC PINSETTERS; on the Rake Crank Lever Assembly and on the Jogger Arm Assembly. The photo shows the location of the sealed GUIDEROL Rake Crank Lever application in the "mechanical brain" of the machine. The sealed GUIDEROL bearings help keep the "brain" highly efficient, with a minimum of maintenance. In the Rake Crank they are not relubricated and operate indefinitely on retained lubricant. Effective seals keep out dirt and foreign matter.

New mower design takes high cutting loads on Sealed GUIDEROL bearings

These unusual field mowers manufactured by Kosch Mfg. Co. use two seven foot cutting bars for a 14 foot cut with one tractor. The second bar depends on a $\frac{7}{8}$ " sealed GUIDEROL bearing to carry up to 7000 pound loads produced in the connecting drive for the reciprocating knife. Earlier sleeve and lower quality needle bearings were discarded for sealed GUIDEROL bearings that have prevented costly field breakdowns.

McGILL MANUFACTURING COMPANY, INC., BEARING DIV., 301 N. LAFAYETTE ST., VALPARAISO, INDIANA

March 2, 1959

Strike Odds Dip as Steel Stocks Rise

Steel inventories will be at 20 million to 21 million tons by June 30 when the three-year labor pact expires. While inventories will still be considerably below the high level prior to the 1956 strike, the buildup lessens economic pressures on the producers and lowers the odds for a strike this year. Consumers will have enough steel on the shelves to see them through a four to six week work stoppage at the mills. The buildup will keep the industry operating at near record levels throughout the first half.

Eisenhower on Steel Wage-Price Increases

Because of the headlines and interpretations about what President Eisenhower said last week concerning steel price and wage increases, STEEL repeats the question and answer. Reporter: "Senator Kefauver has proposed the steel industry forego the price increase if the steel union limits its wage demands to an amount equal to the average increase in its production. What do you think of this?" President: "I have always urged that wage increases should be measured by an increase of productivity. I am talking a little out of my depth here because I am not an economist, but it looks to me like they (steel companies) wouldn't really have to have an increased cost if this wage drive was measured by that criterion (equate wage boosts to productivity gains)." He added that a company should not have profits cut too low.

Needed: More Unanimity on Depreciation Reform

Our federal depreciation laws force industry to overstate profits to such an extent that your company may actually be taxed at an 80 per cent rate rather than the statutory 52 per cent. We need reform now, say U. S. Steel Corp.'s R. C. Tyson (right) and nearly all of the other 918 metalworking executives questioned by STEEL on the kinds of reform they prefer. No single approach has the majority's favor (Page 69). Since a majority can't agree on what should be done, it's not surprising that Congress has enacted no broad depreciation reform. Needed: An approach that most industrialists can support.

Labor Strife May Follow Lewis' Retirement

Metalworking managers will want to keep a weather eye on what may become a tumultuous era for the United Mine Workers. Age and illness are hastening the retirement of John L. Lewis, 79. Long term peace in the coal

fields may be destroyed if rival district chiefs get entangled in a power struggle. Another potential source of trouble: Other industries may face organization battles if the UMW continues to expand in nonmining areas.

Electric Auto on Comeback Trail

With small car production just getting into full swing, the auto industry may have to grapple with a second new market factor: The electric auto. Two companies are reviving it. New, lightweight batteries have sparked the comeback, with an assist from glass fiber bodies (Page 74). Electric utilities are interested because battery charging would boost power consumption.

Detroit Plans Its Small Car Bid

Metalworking will have a ringside seat this fall as Detroit's heavyweights square off for round one of the small car contest. Autodom's Big Three, unable to ignore the 15 per cent chunk of the market snatched by the Lark, Rambler, and foreign makes, are rushing to meet 1960 introduction dates (Page 73). Annual small car sales of 3 million units by 1963 are predicted by George Romney, American Motors Corp. president. He says: "The Big Three's development of compact cars signals the end of the era of big car sales domination in the U. S. and a rapid rise in compact car sales to the position of leadership."

Price of Bad Air: \$7.5 Billion

You'll want to follow the course of federal and local legislation on air pollution; it's a costly problem for most industries. Bad air costs the nation \$7.5 billion a year, a figure that will rise drastically in the next decade. The figure covers cost of control equipment, research, and damage from uncontrolled pollution. Congress will consider extension of the Air Pollution Control Act at this session. With abatement responsibility in the hands of state and local governments, you could be hit at any time by being forced to install expensive equipment. Or, falling local property values might bring a compensatory tax hike (Page 84).

Jobless March on Washington O.K.'d by AFL-CIO

Walter Reuther, United Auto Workers' chief, has won support of the AFL-CIO high command for his planned march of the unemployed on Washington (no date has been set). Approval was given by a reluctant George Meany. The federation president had been holding out for a union caucus to recommend economic aid legislation for idled labor. The agreement to sponsor a jobless gathering came in closing sessions of the AFL-CIO executive council's winter meeting in San Juan, Puerto Rico. The meeting was marked by a growing rift between Messrs. Meany and Reuther; the auto workers'

chief got his way by threatening to quit as the federation's economic policy chairman.

New Machines Quicken Riveting Pace

If riveting is on your list of problems, hear this: Machines for this type of fastening have been upgraded and they're faster. Some are equipped with multiple station indexing tables. Others have automatic feeds and can handle two rivets with a single stroke. STEEL (Page 120) brings you up to date on what the machinemakers have been doing to keep pace with today's demand for more improvements.

Coming: Wheelless Vehicle That Rides on Air?

"I foresee the day when the wheel will have reached its top speed capabilities," says A. L. Haynes, director of Ford's engineering research. It has developed the Levacar, an experimental wheelless vehicle that rides on a thin film of air a fraction of an inch above the roadbed. Instead of wheels, the Levacar employs "levapads" enabling the unit to slide at high speeds, using air as a lubricant. One possible application of the Levacar might be on rails. A turbojet could power it up to 500 miles an hour.

Gas Toolmakers See \$40 Million Year

Gas welding and cutting toolmakers look for \$40 million worth of business this year, a 14 per cent pickup. Chances are your maintenance department is a user of gas welding equipment. Gas cutting is widely employed in multiple shape cutting production. Producers can supply custom built automatic cutting machines, although large and complicated cutting units have become standard equipment in many lines (Page 81).

Outlook Bullish in Business Community

Rising sales and profits are expected this year by 77 per cent of 1542 business executives interviewed in a recent Dun & Bradstreet survey. Of the dissenters, 20 per cent foresaw no change over last year and only 3 per cent expect a sales dip. The proportion looking forward to profit gains was highest among manufacturers of durable goods. Twenty-seven per cent expect to boost prices over last year's; 70 per cent contemplate no change.

New Nozzle Means Hotter Missile Fuels

More powerful solid fuels can now be used in the Polaris and Minuteman missiles with installation of a movable molybdenum nozzle in the tail. The

nozzle, built by Cleveland Pneumatic Industries Inc., is made of cast molybdenum rings mounted on pinions; it had been used as a control device.

Take a Look at New Machine Values

You may pick up some profitable ideas from an equipment replacement study conducted by Barber-Colman Co., Rockford, Ill. (Page 118). Three new presses for assembling electric motors were bought when the study showed they would not only increase production, but halve the cost of hand assembly methods. The company uses modified interpretations of a Machinery & Allied Products Institute formula and maintains a continuous audit to determine if the new equipment purchases were justified. Auditing results provide a basis for decisions on future equipment purchases.

Krupp Empire Not Likely To Crumble

Alfried Krupp's industrial empire in West Germany did more than \$800 million in business last year—not bad for an industry supposedly dismantled by international agreement. U. S. foreign traders will feel the effect of Krupp's amazing rebirth; the company's last financial report showed a 30 per cent jump in export business over the previous year. Krupp production mounts annually; the firm's new engineering arm has a world-wide reach. Planning a resurgence in steelmaking, Herr Krupp is negotiating to raise his share of West Germany's steel production from 9 to 16 per cent (Page 76).

Shipbuilding Hits New Peacetime Highs

New world shipbuilding records were set last year with peacetime production nearing the war year spurts of 1943-44. Japan again reigns as the world's leading shipbuilder; for the first time, West Germany is second; the United Kingdom slipped to third place, the lowest position it ever held. U. S. ship launchings ranked fifth, behind Sweden. Lloyd's Register of Shipping reports these gross tonnages: Japan, 2,066,669; Germany, 1,429,261; United Kingdom, 1,401,980; Sweden, 760,206; U. S., 732,381.

Straws in the Wind

Canadian steelmen report an uneven pickup. Some fabricators are starving; others are fat. Steel's capital outlays are expected to be high this year; new mills are being built on the St. Lawrence in Quebec . . . Chrysler Corp.'s new South African company will assemble Chrysler and Simca cars in its 215,000 sq ft plant—60 cars and 12 trucks daily . . . Published, but unconfirmed, reports have it that GM has been readying plans for spinning off its Chevrolet Div., if the Justice Department decrees a divorce . . . American Can Co. says falling aluminum prices are bringing on the day when the metal will compete with tin plate in can production on a gage-for-gage basis . . . Agriculture Department has removed nine strategic minerals from its foreign shopping list, 28 remain.

Let's Agree on . . .

Depreciation Reform

We have no realistic depreciation allowances on capital equipment in this country because industry can't agree on how they should be figured.

As evidence, the editors of STEEL present the results of a survey (Page 69) showing that about 40.1 per cent of metalworking executives want the bracket system advocated by the National Machine Tool Builders Association.

Some 37.7 per cent want a speedup of allowances such as the triple declining balance system sponsored by the Machinery & Allied Products Institute.

And 12.7 per cent want reinvestment depreciation allowances providing for the higher cost of replacing obsolete equipment. It is sponsored by the railroads, steel, copper, and coal companies.

Less than 2 per cent want special inflationary credits.

While a majority can't be mustered for any one approach to the depreciation problem, the survey reveals a general area of agreement. It can be the foundation for developing a single plan on which all industry can get together.

The depreciation rhubarb has been going on for years. It will go on for many more unless industry makes up its mind that it is going to present a united front.

How can our lawmakers be expected to know what action to take if industry can't tell them what it wants?

MILWAUKEE WROT WASHERS

Clean as a Whistle!
because they're

WASHED!

Clean washers are essential to today's high standards of clean workmanship. Your assemblies — down to the last nut and bolt — must be clean.

When you use Milwaukee *washed washers*, workers' hands are kept clean. Cleaner workmanship results, assembly lines move faster, costs are lower, profits higher, your customers better satisfied! There is no grease, grime, graphite or other foreign matter to rub off on workers' hands or the work they are handling.

As a plus value, the Milwaukee Wrot Washer washing process includes rust-resistant treatment. It is used on all popular sizes of U. S. Standard and S.A.E. Washers, Rivet Burrs, and Machine Bushings.

Since the introduction of this washing process, industry has specified Milwaukee *Washed Wrot Washers* in a BIG WAY — but whether you specify "washed washers" or not — that's the way they reach you. Clean as a whistle, and made to match your own high standards of quality and cleanliness!

What Depreciation Reform Does American Industry Want?

STEEL queried 918 metalworking executives and found . . .

40.1% want Bracket System

This would abandon the concept of useful lives. Substituted would be brackets or maximum and minimum yearly limits for 10 or 15 categories of depreciable property, as in Canada. Taxpayers could pick any year within the bracket.

37.7% want Speedup of Allowances

They would retain the present useful life concept but allow faster writeoffs—either by the triple declining balance method, or with an initial allowance of the British type and a double-rate write-off, that would accomplish the same result.

12.7% want Reinvestment Depreciation

When the property is retired, you can deduct the difference between its value in current dollars and its cost at the time it was acquired. That amount, added to what was already written off, will compensate for the decline in the dollar. The deduction would be allowed only to the extent that an equivalent investment is made within two years of retirement. The method would work under the present schedule of useful lives or under a bracket system.

1.8% want Inflationary Credit

Accelerated depreciation would be allowed on property up to some specified amount, perhaps \$50,000. A variation is already law. It allows a 20 per cent writeoff in the first year of acquisition if the property's cost doesn't exceed \$10,000. It covers new and used property.

7.7% want Other Methods of Reform

Among a dozen other proposals, these stand out: Combine the bracket system with reinvestment depreciation; give the taxpayer the freedom to depreciate his assets any way he pleases, so long as he doesn't change his method.

Executives Tell Why We Need Depreciation Reform Now

CARL L. HECKER, president
Oliver Corp., Chicago

JAMES H. HUNTER, president
James Hunter Machine Co.
North Adams, Mass.

NEEDED: A fresh approach to depreciation reform—one that the majority of industry will support.

To help you gage the currents and crosscurrents in industry's thinking on the subject, STEEL came up with a first. It asked 918 metal-working executives: "What type depreciation reform do you prefer?" The findings (Page 69) offer new insight into why one of industrial America's most frustrating problems, the rigid and archaic federal system of tax depreciation, is not being solved—why Congress has made only patchwork reforms.

The most important revelation from STEEL's survey: Industry's lack of agreement on what needs to be done. Note that even the most favored of the approaches—the bracket system—polled only 40.1 per cent of the votes.

America's system of tax depreciation, based on a schedule of useful lives that hasn't been changed since 1942, places a heavy burden on most equipment owners in writing off their capital assets for tax purposes. Average life allowed on machinery is 20 years, even though much of it becomes economically, if not physically, obsolete in a far shorter period.

What's more, our tax laws make no provision for inflation. Most other industrial nations do.

What's It to You?

Management's apathy is another reason why Congress is slow to en-

"We'd like to have the bracket system because:

"It's simplest to administer.

"It keeps the federal revenue agent out of it.

"It requires less clerical effort.

"It requires less change in our clerical system.

"It has worked well in Canada."

act reform. At hearings before the tax-writing House Ways & Means Committee last year, nearly all the witnesses were accounting and legal specialists. Few industrialists testified, and congressmen got little mail from businessmen seeking reform.

The same attitude was indicated in a few of the survey replies. "The subject is too complex to discuss," says a Tulsa respondent.

Many other businessmen concede that the problem is complex, but they think one object in reform would be to simplify the system so it can be more intelligently used by industry. "I believe the many complicated plans should be junked and a simple system adopted," says J. E. McIntyre, vice president and general manager of Sibley Machine & Foundry Corp., South Bend, Ind. Any reform "should minimize detail," cautions Malcolm Lamont, secretary-treasurer of Detroit Harvester Co., Oak Park, Mich.

"Depreciation reform is not of direct concern to us," claims the

"As president of the American Textile Machinery Association, I have been actively seeking depreciation reform the past two years. Our group has worked with American Cotton Manufacturers Institute on revision of Bulletin F (and speedup of allowances). We are optimistic about some realistic revision."

president of a Minneapolis firm. The large majority of respondents would challenge him. Hear N. T. Harrison, treasurer of Jones & Lamson Machine Co., Springfield, Vt.:

"Depreciation reform would reverse the recessionary trend in capital goods, stem inflation, provide a powerful weapon for the U. S. to combat Russia's economic warfare, and help to balance the federal budget."

Even if reform accomplishes only half that, it's of direct concern to you and you and you. The logic supporting Mr. Harrison's statement is the estimate that reform would boost capital goods sales, perhaps to more than \$3.5 billion yearly. Better equipment would mean goods produced at lower or stable costs to stem inflation. If we could become more competitive in world markets, we could combat Communist economic warfare more effectively. Finally, the improved business would mean more profits and taxes, to help balance the U. S. budget.

R. C. TYSON, chairman,
finance committee
U. S. Steel Corp., New York

J. A. RATERMAN, president
Monarch Machine Tool Co.
Sidney, Ohio

PHILIP HAWKINS, president
Texas Steel Co.
Ft. Worth, Tex.

"I would support any of the more important proposals acceptable to Congress. However, it is my feeling that reinvestment depreciation would do more for industry and the country than would the others. This proposal follows closely the accepted LIFO principle adopted in the late 1930s for inventories."

"It is relatively simple to take your case before the Treasury Department. If you can show that you replaced your machinery faster than shown in Bulletin F, you can have a special case. Of course, there is a good possibility that the small manufacturer would not take the time and effort to prepare his case."

"The selection and application of depreciation rates should be left to the judgment of the taxpayer. The government should have the right to challenge such rates if they are not applied consistently, or if the government can prove that the rates do not bear a reasonable relationship to the useful life of the property."

How the Trouble Started

Before 1934, the Treasury Department paid little attention to tax depreciation.

The matter became important in 1934 because the U. S. needed money to finance the early New Deal projects. With so little to tax in the midst of depression, Congress proposed an arbitrary percentage reduction in all depreciation allowances. The Treasury countered with a proposal to raise the same amount of money "administratively," by making it hard for taxpayers to establish allowances. The proposal was adopted and embodied in Treasury Decision 4422.

"It was a revenue-raising device pure and simple," says Joel Barlow, Washington lawyer and president of Tax Institute Inc. "It had nothing to do with the merits of one system of depreciation over another."

As interpreted by zealous revenue agents, TD 4422 became a club to

beat taxpayers into unreasonable patterns of depreciation. Obsolescence was virtually removed as a factor in arriving at the useful lives over which an asset could be written off.

The unhealthy situation was compounded by the 1942 edition of the Treasury's Bulletin F. It contains tables purporting to give the "useful" lives of all kinds of assets. The lives are too long because they were based on experience of the 1930s.

Since 1952, three partial reforms have come about:

1. Treasury regulations and rulings reduce to some extent the burden imposed by TD 4422.

2. The Internal Revenue Code provides for two new methods of depreciation. The double declining balance method and the sum of the years' digits permit you to write off the cost of an asset more rapidly during the first years of its life than under the traditional straight line method. They have no effect on the length of the period—the life—

over which the total writeoff must be made.

3. In 1958, liberalized depreciation allowances were provided on a token basis for annual investments up to \$10,000.

"While those were steps in the right direction, they solve in only a partial way the basic depreciation problem," says Mr. Barlow who also serves as counsel for National Machine Tool Builders' Association and other groups.

Under the present system, your company can be taxed at an actual rate of 80 per cent instead of the statutory rate of 52 per cent, charges Frank V. Olds, Chrysler Corp.'s assistant comptroller. The overtaxing is primarily a result of inadequate allowances for depreciation which force corporations to overstate their taxable income.

Favored Three

Where do we go from here?
An examination of reform meth-

How Metalworking Votes for Favored Three Methods of Depreciation Reform

Producers of . . .	Percentage voting for . . .		
	Bracket System	Allowance Speedup	Reinvestment
Machinery, equipment	65.6	54.8	44.5
Basic metals	23.4	16.1	35.2
Fabricated metal parts	11.0	29.1	20.3

Will You Help?

STEEL invites your comments and suggestions on how to mobilize support for the modernization of our archaic depreciation laws and regulations. We, in common with many industry managers, believe the updating of the depreciation system is a must if American industry is to continue strong.

In these pages are the results of a novel poll of metalworking executives. It shows their preferences for the types of depreciation reform they believe would be most beneficial and practical. We made the poll as an industry service. No one before had ascertained what a broad cross section of industry leaders wanted. If you can use the results, please do.

We questioned 918 executive officers in metalworking. Half are equipment builders. The remainder are users of capital equipment. Of course, the builders are also machinery users. Most companies queried employ more than 500, although a sampling of smaller companies was included.

STEEL's editors believe that a realistic proposal for depreciation reform, backed by an articulate and substantial representation of industry, can win approval by Congress. We believe depreciation liberalization is necessary if our industry is to hold its domestic and foreign markets. We believe such a program is essential to our national security.

Will you help?

—The Editors

ods is in order. Here are the three methods favored by respondents to STEEL's survey.

The bracket system got the most votes. It was devised by Mr. Barlow and is modeled after the Canadian method which has been working successfully. It would throw out the concept of useful lives embodied in Bulletin F. Depreciable property would be classified into 10 or 15 categories. Brackets of maximum and minimum useful lives would be given; taxpayers would be allowed to choose any useful life within the bracket without challenge. Most durable equipment would fall into the five-to-ten-year bracket. Depreciation would be figured on the basis of original cost.

The approach to reform with the second largest support is the speed-up of allowances. It was devised by George Terborgh, research director for Machinery & Allied Products Institute, Washington. It's a faster writeoff device. Instead of the double declining balance method allowed in the 1954 reform, we would use triple declining balance. The Bulletin F schedule of useful lives would be retained.

As an alternate to the triple-rate approach, MAPI suggests the British method (depreciate by double-rate declining balance and, in addition, allow a first-year writeoff of 25 per cent for equipment and 12.5 per cent for buildings and structures).

The triple approach gives a gradually building impact. The British method starts with a bang.

The approach with the third largest support is reinvestment depreciation. Its principal architect is Maurice E. Peloubet of the New York accounting firm, Pogson, Peloubet & Co. It works like this:

In the year in which a depreciable property is disposed of or otherwise retired from service, you would determine the current dollars needed to replace that particular asset by referring to a price index.

The difference between the original cost of the asset and the original cost adjusted to current price levels would be available to you as a deduction to the extent that an equivalent investment is made at the time of or within two years of retirement. The amount written off in the first year would be deducted from the depreciable basis of the new property.

What Can We Do Now?

Congress will not vote depreciation reform this year or any year unless it has convincing evidence that the majority in industry favor one approach.

A dozen bills referring to depreciation have been introduced so far. None is the thorough reform industry wants. Rep. Eugene Keogh's (D., N.Y.) measure calls for reinvestment depreciation but limits deductions to \$50,000 in one year. Other bills refer to depreciation only incidentally.

Why the lack of activity on Capitol Hill? Two reasons: Rep. Wilbur Mills (D., Ark.), chairman of Ways & Means, hasn't scheduled any hearings. Treasury may bring in a reform bill, tied to its long awaited revision of Bulletin F.

Concrete action by industry will be aided if a proposed U. S. Chamber of Commerce meeting is held in the next six weeks. Chamber officials agree that industry needs a united front—either in support of one of the more popular approaches already devised or in support of a new one that probably would include features of the three favored by STEEL respondents. Here are some of their suggestions:

- H. E. Tower, controller for Beloit Iron Works, Beloit, Wis., says: "It is necessary to have a combination of a speedup of allowances as well as a more modern useful life schedule."

- Many favor using reinvestment under a bracket system.

- Gerald Carlisle, secretary and treasurer of Micromatic Hone Corp., Detroit, wants this provision incorporated into the bracket system or allowance speedup: "Consideration should be given to changes in production levels. Let a corporation take 75 to 125 per cent of its computed depreciation based upon its production. At a full one-shift operation, 100 per cent would be taken. At anything less than 75 per cent of one-shift capacity, 75 per cent would be taken. At anything over 125 per cent of one-shift capacity, 125 per cent would be taken."

• This is the first in a series of articles on depreciation reform that STEEL will carry in the next several months. An extra copy of this one is available until supply is exhausted. Write Editorial Service, STEEL, Penton Bldg., Cleveland 13, Ohio.

Big 3 Ready Small Cars

They'll introduce one 1960 model apiece. GM's is scheduled to debut in mid-September, Ford's perhaps in late September, and Chrysler's early next year

THE RASH of speculative stories on small cars that has broken out in newspapers is enough to make even automakers' heads swim. A casual count on the basis of these rumors shows that GM is supposed to introduce at least three small cars, Ford two, and Chrysler one or more. This must be fascinating news to the heads of these companies who as of now are planning on introduction of one light car apiece in 1960.

- **GM**—Chevrolet's light car tentatively is scheduled for dealers' showrooms between Sept. 14 and 21, STEEL's sources say. Its unitized body is on a 106-108 in. wheelbase. The engine still is a flat opposed, 6-cylinder job mounted in the rear. It will be about 120 hp and is similar to the Porsche design although this particular model has been under development at GM's Technical Center since 1955. Gray iron cylinders will be sandwiched between aluminum head and crankcase.

GM's forthcoming Slimline Hydra-Matic will be optional. Contrary to published artist's renderings, the car does not resemble Renault's Dauphine. Insiders suggest it's most similar to the 1960 Chevrolet without the fins. Front and rear bumpers are interchangeable. Two door and four door models will be offered initially and a station wagon also is programmed. Weight is around 2300 lb. The car reportedly will be assembled at Chevrolet's Willow Run, Mich., truck plant.

It is true that the corporation has several other light car designs in its shops. They would use the Chevrolet light car body with different sheet metal, and would be marketed by Oldsmobile, Pontiac, and Buick dealers. None of those has been scheduled as 1960 models.

- **Ford**—Despite the alleged quote by Henry Ford II, company presi-

dent, that Ford will build a small car, the company last week would only repeat its original statement that it is studying the small car market and will be ready to move when, and if, conditions warrant it.

Ford Div.'s unitized light car is supposed to appear the last week of September or the first week of October, according to one source. It's been reported as having a 109 in. wheelbase and a 182 in. overall length, but two company men still maintain the wheelbase is 108 in. The car weighs between 2600 and 2700 lb. Similar to the English Zephyr, it has a T-bird roof line.

The engine is a reworked gray iron job with overhead valves. It has 144 cu in. displacement. Differential is in the rear. Ford's two stage, automatic transmission will be optional. Suggested retail price is reported to be around \$1950. Production will start at Ford's Lorain, Ohio, plant.

Reports that Ford's second light car will appear in the 1960 model year are not true, say informants. What is planned is to phase out the present Edsel after 1960 and bring out a second light car under the Edsel name for the 1961 model run. This car will use the Ford Div. light car body. If all goes well, it will have a 6-cylinder aluminum engine.

- **Chrysler**—If no road blocks appear in its crash program, Chrysler could introduce its light car in January, 1960, but the word is that April probably will be the month. Chrysler's entry in this field also will be unitized. Initially, it will use Plymouth's reworked 6-cylinder powerplant, but ultimately it's to be powered by a 6-cylinder engine with an aluminum diecast block. A redesigned, two stage, automatic shift is underway. The car is reported to be in the 106-108 in. wheelbase class. A second light car for Chrysler is at least two years away.

Batteries are in trunk of prototype; they'll be in center of new electrics

Electric Autos Come Back

BATTERY POWERED AUTOS may soon be in the second car category.

Cleveland Vehicle Co. is developing an electric which will be out of the prototype stage by June 1. The research and development project is underwritten equally by Cleveland Vehicle, Atlantic City Electric Co., Electric Storage Battery Co., Detroit Edison Co., and Maust Coal & Coke Co. American Motors Corp. supplied a Rambler American for the project, but AMC officials deny interest in selling or marketing such a vehicle.

Cleveland Vehicle's president, Walter S. Thomas, says the six passenger car will have a top speed of around 40 mph and a range of about 100 miles.

• **Design Features** — The car is slated to feature a glass fiber body on a unitized tubular steel chassis. (For every 500 lb reduction, 5 miles is added to the car's range.) A series wound, 6 to 7 hp motor will be powered by a revolutionary lead-acid type battery now in develop-

ment at the Philadelphia Industrial Div. of Electric Storage Battery. The battery's developer has cut the weight in half (from 2250 to 1100 lb) but retained the 250 ampere-hour, 85 volt capacity of the 44 cell unit. A liquid propane heater will be optional.

• **Tentative Price**—Though production and marketing arrangements haven't been ironed out, Mr. Thomas believes that the car will sell for about \$1835. The battery may become a rental item. Possible figures: \$20 a month for five years and \$10 a month for the remainder of the battery's life (perhaps seven and one-half to eight years).

Mr. Thomas says that heavy, inefficient batteries and complex charging gear led to the defeat of earlier electrics. The recharging problem has been whipped with a silicone diode rectifier which can be bought, rented, or leased. It takes the 12 x 6 x 6 in. unit 8 hours to fully recharge a battery—you just plug the recharger into a 110 volt household outlet. During idle periods, the owner can place a trickle of electricity on the battery to maintain its charge.

• **Advantages** — The new electrics can be kept running for about 1 cent a mile (at 1 cent per kw); insurance may be lower; tires and batteries will last twice as long (because of smooth pickup and low speeds). There are no fumes; operation is almost silent; and the controls are simple—a steering wheel, a brake pedal, and a control lever which serves as a combination hand throttle and gear shift. Five speeds forward and reverse are possible.

• **Trucks Ordered**—Cleveland Vehicle has orders for 42 electrically powered delivery trucks; the first

Electric truck has new batteries, simple controls, and Fiberglas panels

live are due out of production Mar. 15. Mr. Thomas says that 20 are slated for bakeries, and the others are for dairies and utilities. About 225 lb of 14, 16, and 18 gage steel tubing are used in the unitized chassis. Six molded panels of Fiberglas make up the body; and Styrafoam insulates the vehicle. All steel is below the center line of the body as are the 350 ampere hour battery and 10 to 12 hp motor, which places the center of gravity near the axle line. This design feature limits body sway. Wheelbases for the seven models run 72 through 107 in. Through a newly designed steering mechanism, the trucks have a 37 degree steering angle; the 72 in. truck can nearly turn in its own length—no mean advantage in congested traffic.

The trucks feature four corner (125 lb) pneumatic suspension, hydraulic shock absorbers, tubeless tires, and limited slip differentials. The pressed steel wheels may be replaced with aluminum or magnesium types to reduce weight.

With standard equipment, the trucks will be sold for \$2500 to \$4500 f.o.b. Cleveland. But Mr. Thomas might lease or sell trucks and batteries, depending on dealership arrangements. The vehicles will carry their own weight (1000 to 3000 lb) at about 25 mph.

• **California Entry**—Another electric car is being made by Stinson Aircraft Tool & Engineering Co., San Diego, Calif. First five models of the three passenger car are due for delivery this month. Specifications: 58 mph, 100 mile range, two 3.2 hp motors, and a glass fiber body. The retail price is \$2800; 55 utilities have ordered 71 at \$2200 each. Stinson is principally a manufacturer of ground support gear for jet aircraft.

Republic Leases R&D Space

Republic Aviation Corp., Farmingdale, N. Y., leased 30,000 sq ft of floor space from the Fairchild Engine Div. at Deer Park, N. Y. It will house its Research & Development Engineering Dept., pending completion of a \$14 million research and development center next January. The company has undertaken a \$35 million R&D space program.

Chemical Plant Construction 1958-60

Use Category	Millions of Dollars	Per Cent of Total Expenditures
General organic chemicals	801.4	24
General inorganic chemicals	797.2	24
Plastics and resins	392.7	12
Synthetic fibers	254.2	8
Petrochemicals	239.8	7
Special metals	174.8	5
Laboratories	157.1	5
Fertilizer chemicals	115.8	4
Synthetic rubber	53.5	2
All other	307.2	9

Source: Manufacturing Chemists Association.

Chemical Construction: \$1.5 Billion in '59-60

SPENDING for chemical production facilities will total \$1.5 billion during 1959-60, says the Manufacturing Chemists Association. The figure includes nearly \$1.1 billion for construction underway and \$464.1 million for projects to be completed before 1961.

A record \$1.8 billion was spent last year.

The drop is not considered alarming. Reason: Long term goals established after World War II to meet demands for the projected population increase and a rising economy are being realized to a large extent. The average annual new plant and equipment investment has been over \$1 billion for the last 13 years.

• **Steady Growth Foreseen**—Most industry leaders expect new product demand will result in a continued steady expansion of chemical producing facilities.

Preliminary returns indicate 1958 sales will total \$23.2 billion, only 0.7 per cent below those in 1957, a record year.

The MCA report is based on activity within the chemical industry and on chemical operations of firms associated with other industries. Costs of foreign and government financed construction, office, warehouse, and other separate facilities are excluded. So is the installation or modification of equipment in existing plants.

• **Texas Leads** — Expenditures for 1958-60 represent 802 projects in 43 states by 287 companies. Last year, Texas, Louisiana, and California had the highest investments. (Leading producing states: New Jersey, Texas, New York.) The West South Central led the nation in total construction by region, followed by the South Atlantic States, and the East North Central area.

ALFRIED KRUPP

Krupp Breakup Dubious

Germany's new role in Europe and another delay in the disposal of the industrial combine lead many observers to believe Krupp will rise again to pre-eminence

A COMMISSION set up by the U. S., French, British, and West German governments will review agreements to break up the famed Krupp steel and coal combine. It is, in essence, a granting of Alfred Krupp's request for a one year delay in disposing of his industrial empire.

It is the second extension granted the sole owner of the huge enterprise.

The sale deadline for the big Essen steel plant, Huetten und Bergwerke Rheinhausen A. G., was in January. Its price has discouraged buyers. Disposal dates of other Krupp properties come later this year.

Herr Krupp continues to do busi-

ness as usual. He is planning a merger with the Bochumer Verien which would boost his share of West Germany's steel production from 9 to 16 per cent.

• **Krupp Income**—Because he shys from publicity, the financial condition of his organization is difficult to determine. His last financial statement, issued in 1956, reported domestic sales of \$727.2 million, an 18 per cent increase over 1954-55. Export business had reached \$87.4 million, a 30 per cent gain. Total: \$814.6 million.

German sources estimate Krupp's 1957 gross income at \$816 million, a figure which was probably exceeded last year.

• **Magic Name**—The Krupp Works, synonymous with Germany's military might in the eyes of her enemies, has endured a dismantling assault at the end of each of the World Wars. The first failed. The second, it is agreed, is failing.

The survival of the 147 year old dynasty, once selected as Hitler's model enterprise, can be attributed to several reasons:

First, occupation authorities could not be indifferent to Germany's economic state and were obliged to put some of the Krupp establishments to work.

Second, there has been a drastic realignment of loyalties in Europe, necessitating the encouragement of German productivity and friendship.

Third, the loyalty of Krupp employees is enduring. In some families, several generations have worked for the company. There is good reason for such loyalty. Krupp's worker's pension fund goes back to 1858. A worker's housing scheme started in 1861. The Krupp hospital was opened in 1871.

The firm's interest in its workers has not declined. In 1956, the 45 hour, five day workweek was established and 883 new workers' dwellings were completed in Essen.

• **Changing Scene**—The Krupp star isn't as bright as it used to be. After World War II, the facilities of the vertically integrated combine were, to a great extent, disabled or nationalized. Herr Krupp was jailed by the Allies.

But the organization drove on. With the core of its production facilities wiped out, the engineering end of the business branched out more extensively than ever.

Krupp is no longer the biggest German industrial firm, a giant in coal, steel, and steel processing. It is primarily a general engineering company, offering a variety of products and services.

The Allies, unable to decide whether Alfred Krupp was a war criminal, released him in 1953 with the agreement that he would get out of the steel and coal business.

• **The Future**—Because of Herr Krupp's attitude and the changing situation in Europe, it appears that the new combine is here to stay.

World's largest walled prison contains two huge metal stamping plants which are indicated by the arrows. Inside, they look like any other plant

State Prisoners Turn Out Variety of Metal Stampings

METALWORKING is everywhere—even inside state prisons. At State Prison of Southern Michigan in Jackson, 330 inmates file into two buildings each weekday at 7:15 a.m., punch a time clock, then man modern machine shop and stamping equipment.

They are part of the Michigan State Industries plan which was established at the prison for three main reasons:

Provide employment for about 1400 inmates, offer the men an opportunity to learn a trade, and to save taxpayers money.

• **No Marketing Problems**—The two "captive" stamping plants supply 83 counties and some 850 cities with license plates and about 2000 types of road signs. They also make metal furniture for city and state institutions. Plant No. 2 is the license plate division. Among the

many items turned out in Plant No. 1 are: Filing cabinets, office valets, lockers, steno chairs, beds, bunks, wastepaper baskets, coat racks, and road signs. Blueprints for all jobs are prepared in a well equipped drafting room. Special jigs and fixtures are turned out in the machine shop.

• **Offers Higher Pay**—Though production figures aren't disclosed, comments from prisoners who have worked similar jobs outside the pentagonal walls indicate that production standards and equipment are equal to those in stamping plants throughout the U. S. Pay is a little higher than the 15-cent-a-day average for most prison jobs.

There's evidence of humor within the walls. A safety sign, posted on one of the embossing presses, reads: "DANGER—you are fired if you work this side of press."

Jigs and fixtures are built in the prison's completely equipped machine shop which is said to equal any installation in free society

Combination and storage lockers are formed on a Cincinnati brake by one of the inmates. Other parts, except locks, are made in the prison

How Big Is Space Business?

HOW MUCH BUSINESS is there for U. S. industry in space probes and satellites? The industrial effort needed to make 1000 Atlas missiles is about equivalent to the manufacture of 5000 Cadillacs. That number of Cadillacs would be a small percentage of total automotive capacity. The 1000 Atlases similarly represent a small part of capacity in the aircraft-missile business.

Dr. Homer Stewart, planning chief for National Aeronautics & Space Administration, figures that the Atlas (as a space rocket, not as a war missile) should cost 50 times more than the Cadillac. The first Vanguard and Explorer cost much more, in terms of the payload launched, because of the development work required. Dr. Stewart sees space vehicles eventually delivering payloads into orbit for \$300 per pound. Payload costs will run \$100 to \$1000 per pound, depending upon the scientific grade of the equipment involved. Add to that the launching, tracking, and data-handling equipment needed, and you arrive at a healthy dollar picture.

NASA Budget To Quadruple

NASA and its military counterpart, Advanced Research Projects Agency, may spend about \$500 million this year and about \$800 million next year. In two years, NASA alone may spend more than \$1 billion a year, perhaps four times its current budget, says NASA.

All this money, however, must be related to the Cadillac comparison in the sense that the space industry will not require vast quantities of raw materials. Even the military requirements for ICBMs, says Dr. Stewart, "do not require a substantial fraction" of our industrial capacity. Also, we'll probably need fewer space vehicles than military rockets. Instrumentation production runs will be "substantially smaller" than the number of vehicles produced.

Space business will be similar to atomic business in size and quality for a long time. But the industry's contributions may prove far more important to all U. S. business (better communications and weather forecasting, for example) than what it will mean in terms of production volume.

Cheaper Rockets Are Here

NASA reports significant progress on a "poor man's rocket." The Scout is comparatively cheap, simpler than those we now use, and has a high degree of reliability. It may cost half as much as the Thor (which runs from \$500,000 to \$1 million).

The Scout will be capable of putting a 150 lb payload in orbit. Basically, it's a modified Jupiter but all four stages are solid fueled. (Fast developments in solid fuels are closely connected to a less costly space effort.) Other rockets under development include Centaur (three stages consisting of a modified Atlas, a lox-hydrogen second stage, and a solid fueled third stage), and Vega (similar to Centaur, but having a lox-kerosine second stage).

The Titan will be the second stage of a 1 million lb thrust rocket which NASA is planning. A 6 million lb thrust rocket is farther away. This tremendous power pack will be made by clustering 1 million lb thrust rockets—again the cheaper way into space.

Two SBI Act Loans Made

Under provisions of the Small Business Investment Act (passed late last session), the Small Business Administration says it has loaned money to Wagener Holding Co., Wagener, S. C., and Barstow Industrial Development Co., Cartersville, Ga. The two firms will loan construction money to small businesses.

Neither of the firms is connected with metalworking, but the SBA announcement is a good sign that the program is off the ground.

Industry Asked To Help Plowshare

Project Plowshare (the peaceful use of atomic bombs) is in need of funds. The Bureau of Mines wants to try a nuclear device in a western oil shale formation. Seventy oil and chemical firms have been asked to put up half the \$2.5 million cost of the program. Richfield Oil Corp. has been reported dicker-ing with the Canadian government for a device to explode in Canada's oil tar sands.

Iron Ore States Want Action

Senators from North Dakota, Montana, South Dakota, Minnesota, and Wisconsin are asking the Office of Civil & Defense Mobilization to survey the iron ore situation. Growing concern about imports of ore is the reason. They want OCDM to look into better ways of concentrating Mesabi Range ore and taking advantage of the Dakotas' lignite fields. A further step: If the St. Lawrence Seaway could be kept open year around, bauxite could be brought into the Dakotas for reduction to aluminum at the lignite fields.

Sales of Gas Cutting & Welding Equipment

(In millions)

Gas Tools Ride the Uptrend

PRODUCERS of gas welding and cutting equipment expect sales this year of \$38 million to \$40 million as metalworking picks up generally.

If the equipment makers do \$40 million worth of business, they'll score a 14.3 per cent gain over 1958. That's the year which saw the first major break in a long uptrend.

• Production Tool—Gas welding and cutting are at work in virtually all branches of metalworking—autos, aircraft, ships, railroads, tanks, tubing, steel service, sheet metal fabrication. All are showing more life than a year ago.

Improvement this year, as in recent years, will be reflected more in cutting than welding. Estimates show that welding and torch cutting account for about 10 per cent of all high purity oxygen produced and that cutting alone accounts for

eight or nine-tenths of this figure. Some producers believe that gas welding this year will show a further dip, in relation to other major welding processes, despite the fact that it continues to be used in most sectors of metalworking.

• Repair Tool—Broadly, gas welding is used as much for maintenance and repairs as for production (some insist much more). Flexible and mobile apparatus, manually operated for the most part, is required for maintenance and repairs. Production requires automatic equipment and includes such important applications as continuous gas welded tubing. Gas and electric welding are used in conjunction with one another in most production applications.

In gas cutting, the emphasis is clearly on production, as in steel mills (largest users of gas for cut-

ting and similar operations) and in other plants where multiple shape cutting is required. Automatic cutting machines often are custom built, with standard components sometimes used to round out the general assembly.

• Distribution—More than 60 per cent of gas welding and cutting equipment units are sold through distributors. Sales of the larger cutting machines are usually direct. But torches, regulators, small cutting machines, and safety equipment are sold off the shelf, largely through distributors.

There are only four or five major manufacturers of gas welding and cutting machines and accessories. But there are many makers of related items. Over 30 companies make tips; 27 produce torches, and 25 build small flame cutting machines. Price competition is sharp on most items.

Acetylene (suppliers number more than 70) is the most important fuel but natural gas is reportedly making steady inroads.

4,769 years to arrive **ACCURATE HYDRAULIC**

**122 out of 124 hydraulic press brakes
in U.S. aircraft industry are PACIFIC**

Aircraft manufacturers work to the closest tolerances of all industries in metal forming. Douglas Aircraft Company, Tulsa, Oklahoma, with 8 Pacific Brakes (above) is typical of the airframe manufacturers who have selected Pacific for its precise accuracy.

924 PACIFIC Brakes, representing over 95% of all hydraulic press brakes in use today, have operated for an aggregate of 4,769 years to test and confirm PACIFIC designs that have established hydraulic press brakes as far more profitable to operate than mechanical brakes. However, only PACIFIC has precise accuracy, versatility, high speed and dependability that comes from years of experience in manufacturing, developing and improving this unique machine. It is the only hydraulic press brake in daily operation that is actually air bending, straightening, deep drawing, blanking, and doing heavy punching. Accuracy within thousandths of an inch (greater than with any mechanical or other hydraulic brake) repeats itself on every stroke. Ram remains level regardless of location of work on the bed. PACIFIC sizes range from 60 tons to 1500 tons.

PACIFIC HYDRAULIC

Only hydraulic brake built for HEAVY PUNCHING

Pacific is uniquely designed to absorb heavy shock from punching in the hydraulic system rather than in the frame of the brake. Cushioned against shock, punch and dies stand up from 3 to 8 times longer than with mechanical brakes. Photo (above) shows 1" alloy steel plate being punched at earthmoving equipment plant.

MAINTENANCE-FREE for years

Dependable, simplified electrical and hydraulic controls can easily be kept working continuously by any plant maintenance crew. There are no complicated electronic devices. In photo (above) at agricultural equipment plant, the 500 ton Pacific Hydraulic Brake shearing $\frac{3}{4}$ " alloy steel plate with Pacific Shearing Attachment has operated continuously for the first 4 years at a cost of \$5.22 in replacement parts.

at TODAY'S ONLY PRESS BRAKE

PRESS BRAKE

HIGH SPEED operation

Pacific adjustable stroke length can be shortened for rapid stroking. Automatic, self-leveling ram permits use of progressive dies across entire bed of press. The automatically-fed Pacific at automotive parts plant, which can cycle up to seventy $1\frac{1}{2}$ " strokes per minute, is forming 3780 operations per hour in the above photo. In virtually any operation, Pacific's high cycling speed equals or exceeds materials handling capacity.

The Three Levels of

FEDERAL

These activities are fostered by the Air Pollution Control Act:

1. Research by the Public Health Service (Sanitary Engineering Center, Cincinnati).
2. Technical assistance to state and local governments and industry.
3. Collection and dissemination of data on the extent of air pollution.

STATE

Abatement responsibility under the federal act permits:

1. Interstate control (compacts between states may be

Bad Air Costs Us \$7.5 Billion a Year

IS A CRASH PROGRAM to combat air pollution needed? The fact that 1000 delegates attended the Health, Education & Welfare Department's 1958 National Conference on Air Pollution indicates the seriousness with which some regard the problem.

Another sign: Simon Ramo, executive vice president, Thompson Ramo Wooldridge Inc., has told Congress: "We have developed a smog-reducing device for automobiles that we think is the most highly developed in the country. It appears now to be practical for low-cost manufacture and, hence, applicable to millions of automobiles (at least in one area of the U. S.)."

Health, Education & Welfare will spend \$200,000 more in fiscal 1960 than it did in 1959 in seeking a solution to the problem. Spending has run over \$4 million annually since 1958. Next year, "increased emphasis will be given to motor vehicle exhausts," says the department. It regards autos as a "pri-

mary source" of air pollution in heavily populated areas. Spending on auto research this fiscal year will reach \$700,000.

• **Burden on Industry**—Whatever the sources (there are heated arguments about them), air pollution is certain to cost industry plenty of dollars in the future, and probably at a rising rate. Attention is being focused on the subject in the same manner that our water shortage is being pointed up (STEEL, Sept. 29, 1958, p. 58).

• **Effects**—Dr. D. A. Irwin, medical director, Aluminum Co. of America, says polluted air can lead to abatement legislation, requiring the engineering of equipment which must be installed "at great expense." Damage suits can bring additional expense: "Many plants have spent great effort and considerable money in investigating, negotiating, and settling damage claims; then there is the long, expensive litigation

which occurs when a settlement figure cannot be arrived at."

Dr. Herman Hilleboe, commissioner, New York State Department of Health, comments: "Air pollution gnaws away at property values. This triggers a financial dilemma for communities faced with an erosion of normal tax yields. The more this occurs, the greater must industry be taxed to make up the community's fiscal debit."

Sen. Thomas Kuchel (R., Calif.) notes Los Angeles County has the power to order industry shutdowns and to halt auto traffic when smog reaches a certain density.

• **\$7.5 Billion**—Oil industry has spent \$66 million on air pollution control since 1956. Automobile Manufacturers Association guesses research in its industry is costing \$1 million a year. Two member companies of the American Iron & Steel Institute have spent \$84 million on air cleaning equipment since 1950. The total cost of air pollution equip-

Air Pollution Control

needed in areas like the Eastern Seaboard from Massachusetts to Virginia).

2. Setting of allowable air pollution standards.

(Research is too expensive for state and local governments to handle. No provision for such in federal act.)

LOCAL

Federal and state recommendations depend upon community action for implementation through:

1. Leadership of established civic organizations.
2. Standards adopted through efforts of community leaders and industry executives.
3. Public information programs.

ment and research is at least \$1 billion annually. Dr. Mark Hollis, assistant U. S. surgeon general, estimates annual damage from uncontrolled pollution at \$4 billion. Dr. Reuben Gustavson, president, Resources for the Future Inc., pushes the total annual cost to "at least" \$7.5 billion, and adds that we probably have no accurate way of arriving at a figure since the problem is so extensive.

• **Some Payoff** — Many leading medical authorities have expressed the hope that the return on investment in control equipment, now small, can be made attractive enough to spur industry efforts.

Health, Education & Welfare says: "Recovery of a saleable by-product is the ideal solution." It reports a \$12 million investment by 12 plants in Perth Amboy, N. J., has brought "considerable financial return, including recovery of 8000 tons of sulfur per year by one plant." And a market is developing for fly ash. The department says one power company using coal for fuel sold 105,000 tons of fly ash in 1957 for \$1 a ton. It is used as filler in asphalt paving and in cement products.

The biggest encouragement to industry would be fast tax writeoffs for air control equipment. Gov. Edmund Brown of California is reported to be pushing hard on Capitol Hill for this, but the House Ways & Means Committee (which handles such legislation) feels it doesn't stand a chance.

• **Air, Air, Everywhere?**—If your community doesn't have an air pollution problem, you're one of the lucky few. Thirty-nine of New York State's 40 communities with populations over 25,000 have "serious" problems, says Dr. Hilleboe. Ten thousand U. S. communities probably are bothered to some degree, estimates Dr. Hollis. Yet only 400 cities collect data for study.

The problem is no longer just the soot and grit which we can see (visible pollutants in urban air have been steadily diminishing, says Health, Education & Welfare), but the unseen gases, and the new combinations created by gases mixing in the air, or the effect of sunlight on them.

We don't know what is happening to us when we breathe the stuff, but Dr. Leroy Burney, U. S. surgeon general, suggests we must clean the

air anyway: "Before anyone had identified a single causative agent of epidemic diseases, farsighted leaders observed the association between epidemics and filth." Statistics on incidence of cancer are being used by medical men to push air pollution control, though many are not absolutely sure of the relation between the two.

• **Not Industry Alone**—Individuals and municipal services may account for one-third of a city's polluted air, reports Health, Education & Welfare. Space heating and refuse incineration are major sources. Those industries which rely most on coal (electric power companies and iron and steel plants) are rated large sources, but the department reports "great progress" has been made. In plants without dust collecting equipment, 80 per cent of the fly ash may go into the air. It can be reduced to 10 per cent with equipment now available, and could be cut to 2 per cent "with full application of existing knowledge," comments the department.

• **Due for Cure**—Problems still to be solved by the industry, says Thomas Wurts, director, Allegheny County Bureau of Smoke Control, Pittsburgh: 1. Electric furnace effluent. 2. Pushing and quenching of coke. 3. Blast furnace slips. 4. Cheaper methods of controlling open hearth effluents.

Short of increasing dilution of pollutants in the air (higher stacks, for example) or abolishing the offending source, industry can step up control efforts by seven means: Superior combustion chambers, scrubbing facilities, settling chambers, filters, mechanical separators, electrostatic precipitators, and counteractants.

• **Congressional Action?** — Senator Kuchel is sponsoring extension of the Air Pollution Control Act for an indefinite time without a ceiling on the funds to be spent. Originally passed in 1955, it called for a five year program and limited appropriations to \$5 million annually. His bill has been discussed with Public Health Service officials. It will not contain any of the provisions hinted at by more excited air control enthusiasts.

Detroit Plans 1960 Breakthrough in:

Chrysler's Dart hints at next year's forward look

Styling . . .

More fins. More headroom—other inside dimensions won't be changed.

Bodies . . .

Chrysler goes unitized. GM will follow. Lincoln will continue to use it.

Light Cars . . .

Chevy aims for mid-September introduction. Ford figures two weeks later.

Edsel won't come for a year.

GM Eyes Chrysler's Unit Body Plan

SPECULATION about small cars has overshadowed the fact that automakers still plan to build standard cars in 1960. Tooling for next year's models is on schedule, and it looks like the industry is again aiming for slightly earlier introduction dates. At least two lines are supposed to be unveiled in mid-September.

This week STEEL takes a look at 1960 styling trends and basic body changes that will affect automotive designs for the next several years. Next week we'll round up the reported changes in engines, transmissions, brakes, and other components that are expected to appear in 1960.

• **Chryslers Unitized** — The most significant change will be Chrysler Corp.'s switch to a semiunitized body. Because Chrysler has had a high degree of body standardization for several years, unitization lends itself readily to annual sheet metal changes at minimum cost. This is particularly true of the front end, where marketing men now feel

changes must be made every year.

Chrysler's body will use a stub frame to mount the motor, suspension and fenders. The frame will be fastened to the front body sections. This will permit the company to utilize many of its present assembly methods and facilities. The approach will be closely watched by General Motors because it's a natural for GM's manufacturing setup where bodies are built by Fisher Body Div., and front end assemblies are made by each car division. There's no doubt in Motordom that GM will go to unitized construction — probably the stub frame type, and probably in 1961.

In its new body buildup, Chrysler will start with the floor pan. Quarter panels and other sections are joined at the rear by crossmembers, braces, and finished sheet metal. The cowl is fitted to the floor pan and trunk section. This body, minus the roof panel, moves along the line while upholstery, seats, and interior components are installed. Doors are hung and a finished top

section welded in place. The stub frame, engine, transmission, and front chassis parts are then dropped into place. Front fenders are hung last.

• **Looks Lower**—Stylewise, Chrysler will not attempt to change its Forward Look theme, although it will lower the front fender line to give a more dartlike appearance to its cars. The fin line is supposed to start at the front fenders and continue to the tip of the rear quarter panels, which will be slightly lower.

Body dimensions aren't going to be changed much. One report has it that wheelbases will be identical to this year's models, but over-all length of Plymouths and Dodges will be reduced about 2 in. Chrysler will continue to use aluminum for its grilles, but it will not return to brushed aluminum wheelcovers in 1960.

• **GM Gets New Skins**—As anticipated, General Motors' lines will

(Material in this department is protected by copyright, and its use in any form without permission is prohibited.)

have new sheet metal next year, but basic bodies will remain virtually the same. The use of standardized body components saves GM enough so it can afford annual styling face-lifts. Since bodies are little changed, dimensions won't be different from this year's cars. But one report has it that floor pans will be lowered about 1/2 in. and seats will be redesigned to give more headroom in the hardtop styles, without increasing car heights.

Insiders say Chevrolet will retain its quarter panel style but will modify it slightly to eliminate the present bat wing appearance. Oldsmobile is expected to use a more canted fin instead of the oblong shape it has now. Pontiac will remove the "Vs" on top of its quarter panels, and Cadillac reportedly will smooth off its shark tail tip on the quarter panels. Cadillac also will lose much of the chrome it had this year.

Front end sheet metal, particularly hoods and fenders, will be basically the same on all GM cars. Batteries of dual and triple headlights will be continued. At least two GM divisions besides Buick are returning to a zinc diecast grille. On all GM lines, the glass area above the beltline will be slightly increased, mainly by the addition of larger backlights, cutting down into what now is part of the deck lid. Two GM lines will offer swivel seats as optional equipment.

• **Ford Is Conservative**—Flat roof, conservative styling will remain the theme at Ford. Its refusal to follow an industry trend all the way is interesting. It may mark the beginning of an era in which each of the Big Three will develop distinctly different styling themes.

Ford Div. reportedly scrapped much of its initial 1960 model design and has created another style. Sheet metal is modified, but it won't look too different except for the rear quarter panels which are supposed to follow the gull wing look that Buick is using this year. While this sounds radical, company sources claim the fins aren't quite so pronounced . . . give more of a massive than a bladelike appearance to the rear end. Backup lights will be relocated.

Lincoln is expected to restyle the heavily sculptured areas around its

wheels, to give a cleaner, crisper look. Roof lines will be unchanged. The car may be 3 in. shorter, says one source. Grilles and bumpers will give a broad appearance, but some of the massive effect will be gone as stylists try to flow the bumper farther into the front fender area.

Now that it has its unitized body lines on an economical basis, Lincoln will continue with unitized construction next year. (The Thunderbird will also continue it.) There's no evidence that other Ford divisions will attempt unitization through 1962.

• **AMC Restyles**—A major sheet metal facelift is the styling note for Ramblers in 1960. Basic body shells are unchanged, but front fenders will be flattened out and lowered slightly. It's reported that quarter panels are still finned, but the blades blend into the side panels and don't give the "tacked on" appearance that has characterized Rambler design. Roofs are flatter, and the word is the larger Ramblers will have a compound curved windshield. The car may be as much as 2 in. lower.

Wagons To Get Own Style

An interesting trend in station wagons is developing. As they take more of the market, it's likely

that each manufacturer will develop a separate wagon body to be used for all its lines. Now they are adaptations of passenger car bodies. Increased use of interchangeable components for car bodies means that wagons will either be more limited in size or the adaptations will be more expensive.

If a separate body were used, car-builders could make significant changes in styling and interior design that would make wagons even more useful than they are now. The industry is investigating such things as seats down the side, roll top roofs over cargo areas, different suspension systems and drives.

Looking for Auto Business?

If you're a small manufacturer looking for a slice of auto business to fill up your shop, jot down these pointers culled from conversations with industry purchasing agents. Remember that automakers and their larger suppliers avoid parts that have a high percentage of inherent labor cost. They also tend to avoid subassembly parts.

1. Look for semifinished parts that can be put together on the final car assembly lines. Automakers don't go in for semifinished subassemblies.

2. Look for low volume parts that will not be repeated the following year because of model changes.

3. Look for parts that call for relatively small die cost. By the nature of their overhead, automakers prefer to put large volume jobs and parts requiring major die investment into their own shops.

What kinds of parts fill these requirements? Special brackets of all types, used to hang on everything from headlamps to instruments, are naturals. So are zinc and aluminum diecast parts that are used only for one model year or for low volume styles.

Another good bet: Special fasteners that may be used on small trim parts or underbody components. These parts change frequently and are sometimes needed because of last minute styling changes. They require few fasteners, but they're usually of a peculiar shape that calls for hand forming operations. Fastener makers tend to avoid such business.

STEEL INDUSTRIAL PRODUCTION INDEX

(1947-1949=100)

LATEST WEEK **164***
PREVIOUS WEEK **162**
MONTH AGO **157**
YEAR AGO **130**

*Week ended Feb. 21.

Production Index Nears Record Level

STEEL's industrial production index (above) is bucking a trend. In four of the last five years, the trend line has followed a gentle downward slope from January to the usual spring outburst of activity. The lone exception was 1955, another recovery year.

Since the first full week of 1959, the index has gained 5 points, pushing the trend line to a preliminary 164 (1947-49=100) for the week ended Feb. 21. That's 34 points above the corresponding 1958 mark and only 4 points shy of the all-time high set in December, 1956. Within the next four weeks, a new high should be reached.

• **Three Reasons**—The five points needed to break the record should come easier than the preceding five for three reasons:

1. Steelmakers see no letup in the demand for steel until midyear. (See Page 170.) This segment of the index has added 8 points since the first of the year, and it will add at least two more by the time output climbs to the record rate of 2,525,000 net tons a week. This will happen before the end of March, some steelmen believe.

2. Freight carloadings, which have added one point to the composite since early January, will show a loss for the week ended Feb. 28 (Washington's birthday

cuts into that week), but they will rebound and continue to show seasonal gains through the spring. Great Lakes iron ore loadings will swell the total in April and May.

3. Auto production has been a damper on production lately. But now that Chrysler Corp. is back on full schedule, this segment of met-

alworking should add at least one point to the index in the immediate future.

• **Favorable Balance** — The only factor in the index which will not be a positive influence in the near future is output of electric energy. A seasonal downturn following the

Federal Reserve Board. *Preliminary.

holidays cost the composite three points. While this decline is expected to continue until the summer months, it will be minimized this year by the industrial recovery.

Weighing those factors, a record level should be posted in March or early April. If steel operations reach as much as 93 per cent of capacity—which some officials believe they will in June—STEEL's index could establish a high of about 170 before the summer slump sets in.

GNP To Set New Mark

Strong industrial activity, brisk consumer buying, and government spending will push the gross national product to quarterly records this period and the next. The record (annual rate of \$453 billion) was set during the fourth quarter of 1958. That brought the total for the year to \$437.7 billion, says the Department of Commerce. The previous quarterly record (\$445.6 billion) was set in 1957's third period.

Before the strength of the recovery and the magnitude of the inventory turnabout became clear, this publication had forecast this quarter's GNP at an annual rate

of \$462 billion. The estimate appears to be short by as much as \$3 billion. The rate could advance to about \$474 billion in the second quarter. It will dip during the third quarter, depending on the outcome of steel industry wage negotiations, then rise to \$475 billion or \$480 billion in the fourth quarter, the best on record.

Business Community Grows

The recovery has also been reflected in a growth in the business community. During January, incorporations rose to a record high. Business failures rose seasonally but still fell below the year-ago mark, says Dun & Bradstreet Inc., New York.

January's total of 18,773 new firms topped the previous record set in December, 1958, by 2315. It was 43.5 per cent over the total for the corresponding 1958 month. Failures came to 1273 during the month, which was an 18 per cent increase over December. While failures were only six companies below the January, 1958, total, the rate dropped from 53 to 51 per 10,000 listed enterprises because of the constant increase in the size of the business community.

*Preliminary.

National Screw Machine Products Assn.

The downtrend in failures is continuing into February. Only once this year has the weekly figure moved ahead of the corresponding 1958 total, says D&B.

Industries Spot Trend

Most industry reports in the last few days give strong testimony to the strength of the industrial recovery.

Machine Tools—Net new orders for machine tools (both cutting and forming types) in January held above the \$40 million mark, as predicted last week by STEEL (see Feb. 23, p. 69), proving that the rise during 1957's fourth quarter was no fluke. At the same time, producers cut back shipments from \$43,950,000 in December to \$31.8 million and raised their backlogs by nearly a half month's production at current rates.

Freight Cars—Orders for freight cars hit a 19-month high in January, totaling 4007 units, reports the American Railway Car Institute (see table above). With deliveries set at 1940 units, the industry's backlog advanced for the second consecutive month.

Foundry Equipment—This industry waited until the last month of

the year to have its best new order period. December's index of 137 (1947-49=100) was the best since the 145.3 in October, 1957. (See table and graph above.)

Industrial Supplies—In a new index of business activity, the National Industrial Distributors' Association (wholesalers of industrial supplies and equipment) reports that sales in January were 3.2 per cent below December's but 4.2 per cent above the year-ago level.

Intercity Trucking—Another new indicator compiled by the American Trucking Association shows that intercity truck tonnage during the second week of February was 12 per cent greater than it was in the year-ago period.

Vacuum Cleaners—Manufacturers of standard size vacuum cleaners sold 242,516 units in January, reports the Vacuum Cleaner Manufacturers Association. The performance fell short of the pace in both December and January, 1958.

Compressor Bodies—Manufacturers of compressor bodies continued their recovery in November, which was 18 per cent better for shipments than the corresponding year-ago month, says the Air-Conditioning & Refrigeration Institute.

JOHN C. HELIES
Security Eng. Div. gen. mgr.

ROBERT U. CLEMENCE
Hyde Mfg. president

LAWRENCE M. ROBERTS
Research-Cottrell senior v. p.

JAMES L. DANIELL
Green River Steel pres.

John C. Helies was made general manager, Security Engineering Div., Dallas, Dresser Industries Inc. Executive vice president of the division, he assumes added responsibilities of general management following resignation of C. L. Lane, president and general manager.

Robert U. Clemence was named president of Hyde Mfg. Co., Southbridge, Mass. Former vice president, he succeeds Arthur J. LaCroix, now chairman. F. A. Skinner was elected treasurer-comptroller; H. G. Barth, vice president-sales; Alan C. Ferguson, vice president-manufacturing; Russell A. Burton, director of marketing.

Frederick O. Bischoff was made production manager; Gerald Newberg, project engineer for Potter Instrument Co. Inc., Plainview, N. Y.

August J. Breitenstein was made assistant vice president-raw materials, United States Steel Corp., Pittsburgh. He was director-exploration and planning.

Avard W. Taylor was made general sales manager, Mill Product Div., Carpenter Steel Co., Reading, Pa.

Jacob J. Jaeger was named executive vice president, Pratt & Whitney Co. Inc., West Hartford, Conn. He was vice president-engineering. Edward J. Shages, former vice president and manager, Cutting Tool & Gage Div., was made vice president of manufacturing for all operations. Henry J. Fredericks, treasurer-controller, was named a vice president.

Lawrence M. Roberts was elected senior vice president, Research-Cottrell Inc., Bound Brook, N. J. William H. Blessing was named New York district sales manager; Richard H. Betchley, San Francisco sales manager; Robert L. Sferra, sales engineer, San Francisco district. In addition to his new duties, Mr. Roberts continues in charge of engineering and research, duties he has carried out as a vice president since 1954.

Malcolm J. Lang was made sales manager, Cleveland branch, National Lead Co.

R. A. Obringer and J. D. Glenn II were named to new posts in the sales department of Crucible Steel Co. of America. Mr. Obringer becomes staff assistant to the assistant general sales manager-product divisions; Mr. Glenn is staff assistant-titanium and vacuum metals sales division. Both are at Pittsburgh.

James L. Daniell was elected president, Green River Steel Corp., Owensboro, Ky. He was executive assistant to Frank B. Rackley (Green River chairman) in the latter's capacity as president of Jessop Steel Co., Washington, Pa., parent company. Mr. Daniell was assigned in December to co-ordinate production and sales of Green River.

Michael J. Myers was named vice president-sales, Hynes Steel Products Co., Youngstown.

John H. Pimm, sales manager of building and contract parts for Bridgeport Brass Co., Bridgeport, Conn., was named to manage a new plant soon to be constructed in Moultrie, Ga., to make tubular plumbing goods. Douglas C. Graham, former sales manager, Condenser Tube Div., was made assistant sales manager-brass mill products, replacing Renald W. Frederick, recently named assistant to

the president. **Philip E. Bush** succeeds Mr. Graham.

Doehler-Jarvis Div., National Lead Co., Toledo, Ohio, named **John W. Thees** production manager. **Charles I. Hodgson** was made manager of Plant 1, Toledo, succeeding Mr. Thees. **Richard M. Hindman** succeeds Mr. Hodgson as sales manager of the division's two Toledo plants.

National Malleable & Steel Castings Co. appointed **William M. Ewing** vice president-general manager, Capitol Foundry Div., Phoenix, Ariz. He succeeds **Edward A. Spring**, founder of Capitol Foundry Co., and general manager of the division since acquisition in 1952. Mr. Spring continues to act as a consultant and on special assignments. **Lawrence G. Blackmon**, general superintendent, Sharon, Pa., Works, succeeds Mr. Ewing as works general manager. **Kenneth L. Selby**, vice president - engineering, Transportation Products Div., Cleveland, was made vice president-general manager.

Carl W. Shattuck was elected president, **McKiernan-Terry Corp.**, Harrison, N. J. He was first vice president, and previously was in charge of the Dover, N. J., plant. **John C. Smaltz** resigned as president to devote his time to the engineering and research work of the corporation as its consulting engineer. **Frank Hamilton Jr.** was elected vice president, and assumes Mr. Shattuck's post as general manager, Dover Works. **Herbert G. Dillon** was elected first vice president, and remains in charge of the Mead-Morrison Div. at Harrison.

H. Richard Ford was named sales manager, Kokomo, Ind., Div., **Kingston Products Corp.** **George Kelly** was appointed to the Detroit sales office, representing the Douglas Mfg. Div.

Raymond M. Waggoner takes over the post he formerly occupied as vice president in charge of west coast operations for **Hubbard & Co.** During the last two years, he played a major role in effecting consolida-

tion of the Pittsburgh and Chicago pole line hardware plants, building and staffing of the electrical research laboratory, and the moving of executive offices to Chicago.

Ralph A. Smith was appointed chief materials and test engineer for **Fulton Sylphon Div.**, Knoxville, Tenn., **Robertshaw-Fulton Controls Co.** He was chief metallurgist and chief project engineer, materials section.

Philip D. Moore was made manager of **General Electric Co.**'s union relations service, New York. He is responsible for basic research, planning, and counsel on relations with labor unions representing GE employees, and for negotiating national level labor contracts.

Robert M. Snyder was made general manager, **Dis-Die Steel Inc.**, Warren, Mich.

John H. Mullaney was named manager, Purchasing Div., **Louis Allis Co.**, Milwaukee. He succeeds **Hans M. Larsen**, who will be a consultant until retirement at the end of the year.

Wyman-Gordon Co., Harvey, Ill., named **Charles M. Demster** purchasing agent to succeed **John H. Roe**, retired.

Arthur B. Williams, sales manager, **Engineered Electronics Co.**, Santa Ana, Calif., was elected a vice president of the firm, a subsidiary of **Electronic Engineering Co.** of California.

C. L. Fiegel was named eastern sales manager, **Acme Electric Corp.**, Cuba, N. Y. **Ken Burton** was named western sales manager, with head-

Combination of machinability with ductility and conductivity called for Chase Tellurium Copper

**Unique Chase Service
helps you find the
one wire that's right**

FOLLOW-THROUGH right to the production line, working with foreman and workers, is one reason the Chase Wire Service Man can help you find the best answer to cold-heading problems. Call on him today!

Before you order wire again, get in touch with Chase. See for yourself how the unique Chase Wire Service Plan can help you. Here's how it works: you tell us what you do with wire—what properties you have to get—describe any problems you may be having. You send us parts, drawings of your products. A Chase Wire Service Man can help you find the one wire that's right for your needs among all those that Chase makes—or if Chase doesn't already make it, we'll *product-engineer* wire for your particular individual needs.

You can only get service like this from Chase—so turn your wire fabricating problems over to the man who knows wire best. That's the Chase Wire Service Man. You can reach him by calling your nearest Chase warehouse or district office, or by writing Chase Brass & Copper Co. at Waterbury 20, Connecticut.

W. Bradley Gilkey was promoted to central region sales manager, Detroit, for **Sparton Corp.**'s Tri-Belt device car, manufactured and sold by its **Allied Steel & Conveyors Div.**

John H. McNerney was elected chairman of the board, chairman of the executive committee, and chief executive officer of **Seneca Wire & Mfg. Co.**, Fostoria, Ohio.

William V. Luneburg was elected a vice president, **Mather Spring Co.**, Toledo, Ohio. He was manager of the Dearborn, Mich., assembly plant of **Ford Motor Co.**, and associated with **Ford** for the last ten years.

Sidney Siegel, for the last three years manager of engineering at **M & C Nuclear Inc.**, resigned to become executive vice president and part owner of **U. N. Alloy Steel Corp.**, Boston, exclusive agent in the U. S. for sales of high speed steel made by **Bohler Bros. & Co. Ltd.** of Austria.

John O. Ekblom was elected chairman of **Hupp Corp.**, Cleveland. He was chairman of the executive committee.

Langdon C. Schaefer joined **Century Electric Co.**, St. Louis, as manager of engineering. He was engineering manager of **Westinghouse Electric Corp.**'s Small Motor Div. in Lima, Ohio. **H. George Nafe** was made manager, headquarters sales staff.

Wayne M. Biklen was made manager of operations at the Staunton, Va., razor and blade plant of **A-S-R Products Corp.** He is in charge of manufacturing, engineering, quality control, and materials functions.

William V. Shakespeare, assistant to the president, was elected a vice president of **Cincinnati Rubber Mfg. Co.**, Cincinnati, a division of **Thor Power Tool Co.**

Ralph A. Purcelli, executive assistant to the general manager of **Rockwell Mfg. Co.**'s Barberton, Ohio, plant, was named general manager of the company's Porterville, Calif., plant. He replaces **Charles N. Perry**, resigned.

Frank Jaworski was made eastern district sales manager, **Engineered Precision Casting Co.**, Matawan, N. J. He was with **Eclipse Pioneer Div.**, **Bendix Aviation Corp.**, serving as chief buyer and head of the Tool Procurement Dept.

George Whitney was made assistant purchasing agent, **Wisconsin Motor Corp.**, Milwaukee.

Perry W. House was made manufacturing manager of the **Anderson, Ind.**, plants of **Delco-Remy Div.**, **General Motors Corp.** He is succeeded as assistant chief engineer by **John D. Baker**. **Forrest A. Stinson** was made assistant general sales manager for original equipment; **R. C. Robertson**, chief production engineer. **John R. Mail** was made Detroit regional sales manager.

Robert J. Russell was appointed executive vice president, **Hardinge Co. Inc.**, York, Pa.

At **Chrysler Corp.**'s Stamping Div., Detroit, **Charles C. Mezey** fills the new post of general plants manager, with responsibility for six plants in Michigan and Ohio. **A. James Savage** was named manager of the Nine-Mile press plant.

OBITUARIES...

Merrill K. Good, 47, manager of electrode sales, **Hobart Bros. Co.**, Troy, Ohio, died Jan. 25.

Henry F. Vogt, 79, former chairman, **Cutler-Hammer Inc.**, Milwaukee, died Feb. 16.

Howe & Fant Sold

Brown & Sharpe acquires maker of turret drilling and jigless positioning devices

BROWN & SHARPE Mfg. Co., Providence, R. I., 125 year old machine tool builder, has purchased Howe & Fant Inc., East Norwalk, Conn., originator and manufacturer of turret drilling and jigless work positioning devices. Acquisition was by stock purchase.

Howe & Fant will become a subsidiary known as Brown & Sharpe Turret Drilling Div. Inc. The East Norwalk plant will be retained with its present personnel.

Product distribution will continue through Howe & Fant's dealers in U. S. metalworking centers.

Brown & Sharpe makes a broad range of milling, grinding, and single spindle screw machines; precision cutting, and inspection tools; machine tool accessories; and hydraulic products.

Arnold Charlat is president of the new subsidiary, succeeding A. S. Howe Jr., who will continue as director.

Steelcraft Enlarges Plant

Steelcraft Mfg. Co., Cincinnati, is enlarging its plant for the production of hollow metal steel doors and frames. A plant addition will contain 50,000 sq ft of floor space. The company has sold its Metal Buildings Div. to Inland Steel Products Co., Milwaukee.

Mesta Gets Inland Award

Mesta Machine Co., Pittsburgh, has been awarded a contract for the manufacture of a 54 in. twin stand, temper pass mill and auxiliary equipment for the Indiana Harbor (Ind.) Works of Inland Steel Co., Chicago.

Designed to skin pass strip up to 48 in. wide at a maximum speed of 7000 fpm, the equipment will include: Two 54 in. temper mill stands with entry and delivery tension devices, cobble knife, and automatic roll polishers; feed reel with double overhung mandrels and elevating coil cradle; tension reel of the automatic shifting type to provide

straight sided coils, with elevating stripper and belt wrapper; oil and grease lubricating systems; and exhaust system.

Mesta will supply auxiliary coil handling equipment, a crop shear, and a coil lowering unit to place the coil on the entry coil conveyor. For the delivery side of the mill, Mesta will provide a delivery conveyor (about 58 ft long), capable of handling seven finished coils, and incorporating a mechanical coil weighing device.

Buys Control of Foundry

Eugene Huebner and associates have purchased a 75 per cent stock interest in the nonferrous Aelco Foundries Inc., Milwaukee. Mr. Huebner has been elected president.

Rolls Ultrathin Strip

American Silver Co., Flushing, N. Y., established a new division to supply almost minuscule quantities of ultrathin and extremely close tolerance metals to laboratories. The metals processed include cadmium, titanium, heat-hardenable stainless steels, and zirconium. A recent achievement was the production of a gold alloy strip only 80 millionths of an inch thick.

Will Build Uranium Mill

Federal Uranium Corp. will construct a uranium processing mill in the Gas Hills area of Wyoming, subject to approval by the Atomic Energy Commission of a concentrate purchase agreement. The mill will be designed and constructed by Western-Knapp Engineering Co., San Francisco. The project, including work to be done by Federal, will cost more than \$3 million. The mill will process 522 tons of uranium ore a day.

Ward LaFrance Forms Units

Ward LaFrance Truck Corp. Inc., Elmira, N. Y., has created six new divisions: Fire Apparatus, Motor Truck, Utility Equipment, Government Sales, Custom Body, and Cargo Container. Officers include: John R. Stone, vice president-op-

erations; J. E. Faehndrich, treasurer; Laurence Witten, vice president-advertising and sales promotion; John A. White, vice president-government relations; P. A. Jenks, general sales manager; R. S. Krause, production manager; G. W. Barr, chief engineer; and J. V. Valego, purchasing agent.

Auto Groups Merge

The Automotive Service Industry Association has been formed by the merger of the National Standard Parts Association and the Motor & Equipment Wholesalers Association. The new group includes over 4000 wholesalers and 375 manufacturers.

A 10 per cent gain is forecast for the automotive jobbing industry by Victor L. Toft, NSPA junior vice president. Reasons: An estimated \$16 billion boost in consumer spending this year, a rise in reconditioning three to nine year old cars, and a travel boom predicted to bring the biggest car travel year in history.

A 15 to 20 per cent increase is seen in overseas replacement part sales for 1959 by J. T. Wolfson, head of Maremont International Corp., Chicago. His forecast is based on greater stability in Latin America.

Low sales of new cars in 1958 benefited the automotive wholesaler, accounting for a 6 per cent sales gain over 1957 and a 12 per cent boost over 1956.

King Graphite Opens Plant

King Graphite Products Inc., producer of graphite lubricating products, has started operations at 21949 S. Telegraph Rd., Trenton, Mich. John L. King is president of the new corporation.

Plans Pilot H-Iron Plant

Bethlehem Pacific Coast Steel Corp. plans to build a pilot H-iron plant in Los Angeles. Crude metallic iron will be produced through a direct reduction process which utilizes hydrogen at relatively low temperatures and high pressures to remove oxygen from iron ore. Engineered by Hydrocarbon Research Inc., the plant will consist of these main components: Drying and

(Concluded from Page 101)
grinding equipment for processing iron ore, reactors in which the iron ore is reduced by the hydrogen passing through it, a unit to manufacture the hydrogen, and machinery to convert the crude metallic iron into briquettes to be used as melting stock for electric furnaces.

Clevite Broadens Service

Clevite Corp., Cleveland, is offering design and production service for specialized titanium and zirconium components. Facilities operated by the Metallurgical Products Dept., Mechanical Research Div., are built around the proprietary high density, high purity powder metallurgy processes. Components ranging from tiny cams and fasteners to valve body parts and complex structural units can be fabricated.

Boosts Honeycomb Output

Solar Aircraft Co., San Diego, Calif., will install a huge furnace for the brazing of large panels of all-metal honeycomb sandwich. The facility is in addition to the furnace being constructed for brazing and heat treating. Other projects include development of a unique traveling furnace technique, investigation of a low cost radiant gas heat method for brazing, and addition of advanced coremaking machines. Solar will quadruple within a year the areas allotted to honeycomb production.

Sturdi-Bilt Changes Name

Sturdi-Bilt Steel Products Inc., Chicago, changed its name to Sturilite Products Inc. Irwin Shayne, vice president, will direct all sales, advertising, and merchandising activities; Lewis G. Eisold is sales manager, Industrial Div.; S. W. Bows, sales manager, Consumer Products Div.; and Paul C. Curtis, manager, Monmouth, Ill., plant.

Kramer Co., both of Milwaukee. Headquarters of the new firm are at 4530 W. Burnham St., Milwaukee, Wis. Officers include: President, Sam Kramer; secretary-treasurer, James Nicholas. The company does general machining, tool and die work, and sells steel.

CONSOLIDATIONS

Clevite Corp., Cleveland, is acquiring Walco Products Inc., East Orange, N. J., and its associated companies, Electrovox Co. Inc., East Orange, and Precision Products Inc., Puerto Rico. If negotiations are completed, the companies will become part of Clevite's Electronic Components Div.

Foote Bros. Gear & Machine Corp., Chicago, will purchase Whitney Chain Co., Hartford, Conn., subject to approval by Foote stockholders. Whitney makes roller and other types of chain and sprockets and devices used in industrial power transmission.

American Metal Products Co., Detroit, purchased Davis Engineering Corp., Elizabeth, N. J., maker of such products as heat exchangers, evaporators, distillation equipment, and lubricating oil coolers. A. O. Jaeckel will continue as general manager of the engineering firm. American Metal produces automotive components, porcelain on steel bathtubs, steel wall panels, hospital beds, metal storage equipment, and precision metal tubing.

Products Div., Globe Co., Chicago, acquired Hilmar Co. Inc., Detroit, manufacturer of expanded metal partitions and panels.

Metal Glass Products Co., Elkhart, Ind., has become a subsidiary of Barler Metal Products Inc., Goshen, Ind. Officers are: President, M. E. Miller; vice presidents, G. H. Dovenmuehle Jr. and R. W. Kintigh; and secretary-treasurer, F. A. Kummeth.

usership

TRADEMARK

• *is readership-in-action*

Usership is the step beyond readership. It sums up the dynamic power to move readers to action that is the life-force of an exciting and influential magazine.

STEEL is metalworking's *Usership* magazine. It serves the needs of metalworking's action-minded leaders as no other magazine does. And because STEEL serves these men so well, they *use* STEEL—base direct business action on what they read.

STEEL's report on "value analysis", for example, touched off a series of management meetings and discussions throughout metalworking.

Usership is also the measure of a magazine's ability to get action for advertisers. That is why today more advertisers are placing more advertising in STEEL than any other metalworking magazine.

usership is the strength of **STEEL**

announces:

a new concept in power brushing tools

How **TY® BRUSHES** will significantly cut your finishing costs

Designed for jobs *beyond the reach* of standard wire power brushes, Osborn TY® Tool Brushes are literally a new concept in finishing tools.

Where rotary files, abrasive stones or belts, tumbling and shot blasting equipment have been used—TY Brushing Methods now do many of these jobs *better . . . at significantly less cost.*

These exclusive TY Brush advantages have been proved through extensive field tests—

- Maximum of work efficiency with minimum of pressure
- Greatly increased brushing action strength
- Positive control over area of brush contact
- Complete uniformity of finish
- Exceptionally long brushing tool life

Osborn TY Brushes will give you a higher rate of output . . . better product quality . . . lower end-of-service cost. Write or call us today for full information. No obligation, of course. *The Osborn Manufacturing Company, Dept. S-4, Cleveland 14, Ohio.*

Blending Gear Tooth Edges and deburring in a single precision operation is done with Osborn TY Monitor® Brush running at 1750 rpm on Brushmatic® 3A Machine.

Cleaning and Finishing internal surfaces of machined castings is done with an Osborn TY Ringlock® Brush mounted on a simple drill press setup. Operation is rapid, thorough—low cost.

fection Metals Products Inc., Birmingham, and will operate the property as a division. Clyde Winter will continue as president of Perfection Metals; Byron K. Sirois, vice president.

Saco-Lowell Shops, Boston, purchased Servo Dynamics Corp., Somersworth, N. H., and will operate it as a wholly owned subsidiary under the direction of A. R. Abbott.

Hughes Aircraft Co., Los Angeles, purchased Vacuum Tube Products Co. Inc., Oceanside, Calif., maker of vacuum tubes, precision electronic welding equipment, diodes, gages, controls, and timers.

McAleenan Bros. Co., Pittsburgh, formerly a subsidiary of Overly Mfg. Co., Greensburg, Pa., has been consolidated with the parent company. Homer A. Wehe continues as vice president and general manager of the new division, McAleenan Plate Fabricating Div. George Tierney is vice president-sales.

NEW PLANTS

Campbell Chain Co., York, Pa., opened a plant at Alvarado, Calif. The building covers 130,000 sq ft of office and manufacturing facilities. Equipment includes heat treating and annealing furnaces and wire drawing, forming, and welding machinery.

Cullman Products Div., Serrick Co., formally opened its plant at Cullman, Ala. The 30,000 sq ft plant is producing aluminum, stainless steel, and anodized trim for automobiles.

ASSOCIATIONS

Cutting Tool Manufacturers Association, Detroit, elected these officers: President, G. N. Popham, Gorham Tool Co.; vice president, K. R. Beardslee, Metallurgical Products Dept., General Electric Co.; and treasurer, G. R. Smith, Na-

New Towmotor "Pace-Maker" Model Fork Lift Truck

Strength to spare!

From tread to mast a Towmotor Fork Lift Truck is *built to last*. Its all-welded chassis—special carbon-steel carriage—one-piece forged forks—reserve-power engine—*rugged construction from the floor up!*—give Towmotor a margin of extra stamina that outlasts any truck doing anywhere near the same day's work.

See how you can apply this strength to *move more goods, faster, at less cost*. Ask for new "Pace-Maker" Booklet SP-23 . . . and Certified Job Studies applying to your type of handling operations. (Also ask about new foot-controlled *Towmostatic Drive*, available now on some Towmotor models.) Write Towmotor Corporation, Cleveland 10, Ohio.

Ceramic engineers examine new LC-R Silica Brick roof.

20% LONGER ROOF LIFE with LC-R Silica Brick

A large western steel company reports that installation of LC-R Super Duty Silica Brick increased their open hearth roof life by 20% over a one-year period. And in comparison with the next best refractory, LC-R Silica Brick averaged 13% more heats to the first patch. This is a remarkable record—another instance where Porter products help keep the refractory cost per ton down.

THE REASON: LC-R Silica Brick is composed of carefully selected raw materials, and is under strict quality control through every step of its manufacture. The result is a stable product with uniform characteristics and consistent quality. Users depend on it to perform with a minimum of variation in service.

For further information write to *Laclede-Christy Works, Refractories Division, H. K. Porter Company, Inc., Porter Building, Pittsburgh 19, Pa.* In Canada, *H. K. Porter Company (Canada) Ltd., Guelph, Ont.*

G. A. Gilbertson, Frank G. Hough Co., Libertyville, Ill., was elected president of the Construction Industry Manufacturers Association, Chicago.

Aircraft Castings Association has been chartered under the laws of California. Allen M. Slichter, Pacific Alloy Engineering Corp., San Diego, Calif., is president. Inquiries to the association should be addressed to the secretary, W. W. Stevens Jr., Stanley Foundries Inc., 6009 Santa Fe Ave., Huntington Park, Calif.

NEW ADDRESSES

Picker X-Ray Corp., White Plains, N. Y., moved its branch office to 75 Varick St., New York, N. Y. The office is in charge of S. T. Green, Picker products manager.

Convair Instruments, a facility of Convair Div., General Dynamics Corp., San Diego, Calif., moved to larger quarters at 3595 Frontier St., in San Diego. The project was known formerly as Datafax Instruments and had its headquarters at La Jolla, Calif.

Texas Eastern Transmission Corp., Shreveport, La., will move the offices of its financial vice president, treasurer, secretary, and director of public relations to the Memorial Professional Bldg., Houston, Tex. The moves will be made over the next several months.

NEW OFFICES

Pittsburgh-Des Moines Steel Co., Pittsburgh, opened district sales offices at 200 E. 42nd St., New York, N. Y., and at the company's new fabricating plant at Curtis Bay Station, Baltimore, Md. J. E. O'Neil is the New York district manager. The Baltimore office is under the direction of C. R. Ford.

March 2, 1959

MOLYBDENUM PROGRESS—A new one-step process for making pure molybdenum powder is five to eight times faster than two-step processes, says Metals & Residues Inc., Springfield, N. J. Its product is of higher purity and uses heat more economically. The percentage of recovery is also said to be greater. Dr. B. H. Davidson, technical director, estimates savings may reach 30 per cent. Significance: Growing emphasis on high temperature materials has increased the demand for the metal in protective coatings and as an alloying element in the atomic energy and missile fields. Benefits of the process will also be extended to other refractory metals like tungsten.

PACKAGED IGNITION—Transistors are the basis of a new high voltage ignition system for automobiles. The maker, Electric Auto-Lite Co., Toledo, Ohio, says the system is maintenance-free and that distributor contacts and condenser replacements are unnecessary. The entire package is slightly larger than a conventional ignition coil. Voltage output is uniform at high and low engine speeds. (Output of regular systems drops 50 per cent at high speed.) Price: Comparable to power steering package.

DIAMOND POTENTIALS CITED—Now that a natural and synthetic stones are vying for your business, you may find it profitable to check into new industrial processing applications. J. D. Kennedy, Metallurgical Products Dept., General Electric Co., Detroit, told the Society of Mining Engineers in San Francisco that the original price of \$5.10 per carat for the manmade product has declined considerably and that quantity is unlimited. He also pointed out that diamonds are five times harder than materials next in hardness.

BETTER FLUORESCENT LIGHTING—Cheaper, brighter fluorescent lighting is the object of a transistorized device being developed by General Electric. Its Nela Park group says it will make high frequency lighting systems more practical for the small and medium sized shops. The efficiency of such systems is now limited by the large converting devices needed to change 60

cycle current to 450 cycles, 600 volts. All users are expected to benefit since the transistors can be placed next to the lighting, eliminating the need for high voltage lines.

DEEP HOLE ROUGHNESS—How do you measure surface finish in a 5/32 in. hole 2½ in. deep? Stanford Research Institute, Menlo Park, Calif., made a device for that purpose for the California Pellet Mill Co., San Francisco. It's used to check a rotary die which extrudes feed pellets and depends on a high quality surface for efficient operation. Sensitivity is 0.0001 in. Brush Instruments Div., Clevite Corp., Cleveland, has made one that will detect 0.000001 in. defects, although depths are limited to 2 in. in holes ¼ in. in diameter.

HIGH TEMPERATURE RESEARCH—A fundamental study of metals which dissolve in their own salts has shown that it may be a promising method for purification. Nickel, for example, dissolved in nickel chloride at 1800° F will recrystallize, leaving the impurities in the salt solution. The object: A more practical way of refining metals or a new way to produce metals in new forms, says Stanford Research Institute, Menlo Park, Calif.

ALUMINA FROM COAL—Mining interests are digging into the possibility of recovering high grade alumina and aluminum sulfate from coal mine wastes. Laboratory and pilot plant operations have been going for about a year, says North American Coal Corp., Cleveland.

STRIP FROM SCRAP—If you dislike throwing away almost useful pieces of thin sheet metal, you'll welcome a butt seamwelder which joins several scraps into large pieces that can be worked just like a single piece. The method, proposed by Precision Welder & Flexopress Corp., Cincinnati, is being tried by automen and appliance makers and is being touted as capable of saving several million dollars a year in those areas. Early reports indicate that some users have been able to cut their scrap wastage in half.

Drawing shows method of descaling one strand of rod in a double pass through the abrasive blast. The three shotblasting wheels are set 120 degrees apart

Wire Prepared for Drawing By Mechanical Descaling

Method used by fastener manufacturer is competitive cost-wise with pickling and drawing. The minutely cupped surface holds lubricants, is smoothed out in drawing

PLANTS that cold draw wire, rods, bars, and other shapes can eliminate a costly pickling solution disposal problem by changing over to mechanical descaling methods.

Automatic descaling also eliminates multiple handling of material, provides fast cleaning, makes strand cleaning and coating possible, and gives a good finish for coating and die lubrication.

• **Case History**—At Lamson & Sessions Co., Cleveland, rods are descaled, coated, and drawn into cold header wire in a continuous operation. More than 4 million lb of wire have been processed and made into bolts since the equipment was installed in mid-1957.

Kenneth J. Sorace, chief project engineer, says production costs of the mechanical descaling and draw-

ing process are competitive with pickling and drawing. The company has blast cleaned SAE 1016, 1021, and 1038 wire in its new facilities. Production averages 2500 lb of wire per blasting hour. Rods 13/32 in. and under constitute the bulk of blasting production; it is expected that higher tonnages can be obtained with larger rods.

• **Why Descaling**—The decision to install mechanical descaling in a new plant was prompted by a survey to determine the cost of reclaiming or neutralizing waste pickle liquors and a year's operating data from a pilot blast cleaning line.

The company now has three Wheelabrator shotblasting machines. They are incorporated into automatic processing lines together with coating units and draw blocks. Two lines have phosphating units. The other has a lime coater but will be converted to a phosphating machine.

• **Wire Processing**—Wire is fed

Wire Drawing Is Continuous

Wire drawing setup at Lamson & Sessions. The welding unit is used to join coils of rod into a continuous strand

from a payoff reel or flipper, through a snarl safety switch and a multiroll unit that produces back drag to keep the line taut, then into the blasting machine. From descaling, it goes through the coating bath and into the drawing block.

Equipment can be placed in a straight or U-shaped strand line. The U-shape allows one man to operate the line since his payoff reel and draw block are close together.

• **Blasting Units**—The Wheelabrator machines have three shot-throwing wheels set 120 degrees apart. The abrasive is fed from an overhead storage hopper to the center of the rotating wheel which hurls it against the wire.

Single or multiple passes through the blasting cabinet are possible. Lamson & Sessions set up multi-pass sheaves for both the blast cleaner and the coating line to obtain a suitable speed for drawing.

The company is using S-110 Wheelabrator steel shot. A heat treated grade in a pellet size (about

0.010 in.), it has a hardness of Rockwell C 45. Shot consumption varies with blasting units and with air separator settings; it averages about 50 lb every 4 hours of operation.

• **Welding Necessary** — In the strand process, it is necessary to run a continuous coil. Welding is a must. With care, different diameters and analyses can be joined satisfactorily. Welds may be cut out if desired, but sound welds can be

run through the draw block.

Shotblasted rods can be drawn directly from the cleaning machine with suitable draw-box lubricants. But if lubricant coatings for extrusions are desired, the use of phosphating and stearate base drawing compounds gives a uniform glossy coating.

Control of the phosphating bath is not complicated. It is necessary to maintain the bath at a relatively high temperature to produce coating weights over 500 milligrams per square foot of surface.

The shot produces a minutely cupped finish which provides an excellent surface for carrying lubricants into the drawing die.

• **Maintenance** — Blasting equipment is cannibalistic. Steel shot abrades the interior surfaces of the blasting cabinet. Preventive maintenance is essential to avoid costly breakdowns and repairs.

Each cabinet is lined with hard manganese steel plates. If frequent and proper inspections are made, signs of wear can be spotted early and replacements scheduled before breakdowns.

• **Products Are Many**—Lamson & Sessions has made a variety of extruded, shoulder upset, and cold headed fasteners from the blast cleaned wire. The products meet all the requirements of industry and the company's own high quality standards. All products have been run in quantity without any special difficulty.

• *An extra copy of this article is available until supply is exhausted. Write Editorial Service, STEEL, Penton Bldg., Cleveland 13, Ohio.*

Lamson & Sessions uses 0.010 in. shot to clean boltmaking wire. The bolt shown in the photo for size comparison is $\frac{3}{8}$ in. in diameter

Can You Justify Old Equipment?

Lower lamination section, gaged for the right thickness, is compressed and riveted on a 4 ton Multipress; it is then inserted in the motor field coil

Analysis showed that three presses, while increasing electric motor production, would cost only half as much per year as the hand assembly methods they replaced

IT may pay you to take another look at your old or obsolete equipment.

For example: A replacement analysis by Charles H. Goff, methods engineer at Barber-Colman Co., Rockford, Ill., showed that it would cost \$4846 a year to own three new presses for assembling electric motors. The annual cost of retaining hand assembly methods was \$9588. Promised annual savings: \$4742. The three machines were purchased

from Denison Engineering Div., Columbus, Ohio, American Brake Shoe Co.

- **Decision Easier To Make**—Since 1949, Barber-Colman has used modified interpretations of the Machinery & Allied Products Institute formula in its equipment justification program.

The method helps determine the best ways to invest capital. Management must weigh other factors,

tangible and intangible, in deciding whether to buy new capital equipment, but the formula has helped many companies.

Each replacement analysis made at Barber-Colman includes a written supplement that explains details of the proposal. It states why the equipment is requested and gives detailed calculations of the operating inferiorities of proposed and presently used equipment. If it will cost less per year to own the proposed equipment than it will to retain equipment or methods another year, the purchase is recommended.

Every analysis is audited periodically after new equipment is installed, to see if terms of the justi-

Press bends shading rings, stakes mounting studs, and rivets upper lamination section

Upper and lower lamination sections are pressed together. A 6 station index table feeds parts to the press and ejects finished assemblies

fication are being met. That way management can appraise results of the program.

• **Machines Boost Production** — Three Multipresses were chosen for the assembly line on which the company's new, low cost, alternating current motors are made. Similar presses, used in other motor assembly lines in the plant, were reliable, easy to operate, and cost little to maintain. The three new machines have helped increase motor production.

• **Three Major Operations**—After the right number of laminations for required thickness is selected

and gaged, a 4 ton Multipress compresses and rivets the lower section of the motor field lamination stack. The section is then inserted in the coil.

A modified, 8 ton, 2 cylinder Multipress, made to Barber-Colman specifications, is used to assemble the upper lamination sections. A microswitch controls the flow of sections to the press and prevents piling up. Shading rings, mounting studs, and rivets are inserted in the lamination sections. The lower cylinder of the press does bending, staking, riveting, compressing, and stamping operations. Pressure of the upper cylinder is more than that of the lower; pressures on the two

cylinders are easily regulated.

Upper and lower sections of the lamination stacks are pressed together, forming dovetail joints, on a 4 ton, automatic Multipress, with a 6 station index table. Close tolerances on the table permit aligning top and bottom fixtures properly.

The press is stopped automatically if a lamination section is positioned improperly in the fixtures, if the operator's hands are drawn toward the pressing zone, or if an assembly sticks in the table ejection mechanism.

• *An extra copy of this article is available until supply is exhausted. Write Editorial Service, STEEL, Penton Bldg., Cleveland 13, Ohio.*

This powered machine has a special jaw advance that lets an operator position his part correctly. In practice, a controlled advance like this is available only in manual machines which are more flexible

How To Get the Most from Riveting

Many new advances in application and equipment should be considered. Here are some basic rules and how they are being applied to today's problems

By J. L. HULBERT
Manufacturing Superintendent
Milford Rivet & Machine Co.
Milford, Conn.

PRODUCTION people are still getting a lot of mileage out of rivets.

Reason: Riveting machines have been upgraded and modernized to fit automation concepts.

Here are some of the advantages of riveting small and medium sized components: Low cost, adaptability for fastening metallic or nonmetallic materials, automatic feed, high speeds on inexpensive rugged equipment, and a wide variety of shapes to fit many needs.

But you can't realize the benefits completely unless you select the right rivet, tooling, and machinery.

• **Selection** — The most important

thing is machine capacity. Ask yourself: "What size rivet will it set?" Lightweight machines cannot handle big rivets; heavy equipment can damage fragile assemblies. Throat depth, stroke, actuation, mounting, and flywheel speed are also important.

Throat depth, stroke, and other factors determine size limits. Some people have riveted components, only to find that the assembly couldn't be removed.

Stroke limits the depth of sections to be riveted and rivet length. Not all long stroke machines can handle all rivet sizes. Also, the longer the stroke, the slower the speed.

Actuation is more than just man-

ual or automatic. Machines can have electrical or air power tripped by a treadle, switch, or solenoid.

• **Special Features**—You can also choose various hoppers, several spindles, setting mechanisms, and raceways, as well as a variety of overall dimensions.

Machine capacity ought to be based on the manufacturer's recommendations. It partly governs mounting, actuation, and powering features. For example, manual machines seldom set semitubular rivets over 5/32 in. in diameter simply because the operator effort is too great. Smaller sizes are attractive despite slower speeds because they

Because they're compact and versatile, pneumatic riveters are suitable for production lines. This special (left) has a rotary table which carries parts through five riveting operations. The indexing table controls the riveting heads. In the example at the right, the machine, not the table, controls the feed

are cheaper and an operator has greater control. Both manual and power machines have automatic hoppers. Machines capable of setting tubular steel rivets larger than 3/16 in. diameter usually are pedestal or frame mounted.

Length, as well as diameter, should be considered. Some equipment handles extra long rivets; others have large hoppers for extra storage capacity. Quick-change raceways increase flexibility. When work height varies, you can specify adjustable brackets to accommodate the product. If thickness varies, compensating devices relieve pressure at the end of the stroke.

Multiple spindle riveters are getting a lot more attention as cost cutters. Some have fixed heads and others can be set for varying center distances on the work. Another improvement: Dual hoppers and a single spindle that will set two rivets at one blow.

Most riveters are driven by electric motors. The pneumatic riveter is a recent development. It is light, has a narrow head, large setting capacity, and good mounting flexibility. Some models can be used with in-line slide fixtures or rotary transfer tables for high speed

Here is a double spindle machine with adjustable centers. It sets two rivets with one stroke. When used on only one product, tooling with a fixed center is satisfactory

How Rivets Are Set

Rivet falls into position at start of cycle . . .

Plunger and rivet meet pin in rollset . . .

Pressure is ready to set the rivet

Typical anvils and tools (left to right): Semitubular rollset for drilled rivet, rollset for extruded rivets, anvils for clinching rivet caps, split rivets, and star set types

production assembly. Cycling speed at the high end is limited only by the rate at which the rivets will drop from the feed rail into the jaws. Stroke speed can be adjusted to control the impact on fragile materials like plastics and porcelain.

• **Setting Up**—In spite of an almost endless variety of anvil designs, there are only three basic clinches for small rivets: The rollset (for tubular rivets when maximum strength is required and wall thickness is not excessive); the star-

set (for deep drilled or full tubular rivets and for thickness variations); the prong-set (for split rivets). Any may be used against the work, against a washer, or partly set so that an assembly turns freely.

• **Construction**—Drivers are smaller than a rivet head, but the working end fits the rivet head. The form, diameter, and straight portion of a driver must be properly sized and suited to the rivet.

Jaws are mounted on a sliding member in the casting which supports the hopper system. They are usually spring supported, so the rivet and driver can pass through. Construction depends on head diameter, shank diameter, and length.

Rollsets have four parts: Plunger, anvil, nut, and spring. Outer shape and size can be altered. The rollset is an important factor in obtaining a perfect riveting job.

It is good practice to incorporate hole sizes which will allow the use of standard plunger diameters. It provides maximum tool life and eliminates the tendency of the rivet to swell as it starts to clinch.

When an undersize pin (used to offset certain tooling difficulties) results in locked rivets, you can try pressure pads. A piece of dense rubber or a die spring can be placed around the rollset. Either tends to hold the work above the rollset form, allowing the rivet to make the assembly and upset. Some rollsets often have an integral, spring loaded collar.

In all cases, it is best to have the plunger pin protrude, so it can pick up and help center the rivet.

The anvil tip is another type setting tool. It is used with either split or deep-drilled rivets. It clinches the tips after the rivet has pierced the work.

Rosette or star tips accurately cut the rivet shank in equal segments. They can be used with washers. A plunger-type star set, with a star on the plunger tip, can be used with the deep drilled rivet. It is helpful where a portion of the work is pierced blind and the other component is located by means of the proper size hold and plunger.

Many ingenious devices reach into limited spaces. But it is best to avoid small, fragile tools—they are expensive and easy to break.

at Bridgeport Brass Company, Indianapolis, Indiana

Continuous annealing and pickle line with **USS** LORIG-ALIGNER Strip Tracking System increases capacity 12,000 lbs. per hour

THE installation of the Bridgeport Brass continuous annealing and pickle line in August 1957 has increased their strip producing capacity 12,000 lbs. per hour, with a corresponding increase in over-all quality and yield.

"There's over 800 feet of strip in this line," says Plant Engineer R. J. Gardner. "And we have no trouble with strip centering or alignment. The LORIG System has prevented tracking problems."

The LORIG-ALIGNER Strip Tracking System is adaptable to processing lines in both the ferrous and non-ferrous metals fields and provides constant control of strip or web alignment. Centering and aligning forces are inherent in the "system" since the specially designed complement of rolls has the ability to maintain strip material on the strip pass-line without the use of complicated exterior sensing and control devices.

For additional information about the LORIG-ALIGNER Strip Tracking System, fill in the coupon.

USS and LORIG-ALIGNER are registered trademarks

General view of entry end of annealing line.

The brass strip passes over a Type II LORIG-ALIGNER Roll and under the pinch roll as it enters the line cleaning unit. Shown here are Mr. Fred Ennis, Foreman; Mr. R. J. Gardner, Plant Engineer; and Mr. W. C. Roll, Supervisor of Plant Engineering, Bridgeport Brass Company's Indianapolis plant.

Analyzer can be operated with unskilled help, claims the maker. Gun (inset) aids sample preparation. Trigger releases plunger which sucks molten metal into a glass tube

Fast Oxygen Analysis Speeds Steelmaking

Several steel firms are employing a new device which determines oxygen content of steel samples in 5 to 8 minutes. Accuracy is within 0.0002 per cent

METALLURGISTS have a new device that speeds determination of oxygen in steel samples.

Called a conductometric oxygen analyzer, it can process a 1 gram sample in 5 to 8 minutes with an accuracy of 0.0002 per cent. A number of steel firms have started to use the instrument. One in eastern Pennsylvania replaced a vacuum fusion system which took nearly 45 minutes per sample.

• **Operation**—Samples are prepared and placed in a graphite crucible which is held inside a reaction tube or furnace. An inert gas is purified and passed over the crucible while it is heated inductively. Oxides in the sample reduce to carbon monoxide which mixes with the inert gas. After passing the mixture through an oxidizer, carbon monoxide becomes carbon dioxide which is measured in a conductivity

cell (called a conductometric analyzer).

The cell is an electrical device (Wheatstone bridge) incorporating some barium hydroxide. When carbon dioxide is passed through the chemical, its resistance changes and careful measurements can be correlated with the percentage of oxygen in the sample.

• **Components** — The equipment combines a purification unit for the inert gas, a high frequency induction furnace with reaction tube, and the conductometric carbon analyzer. The maker, Laboratory Equipment Corp., St. Joseph, Mich., says the system is easy to install, doesn't require a glass blower, and

can be operated by unskilled people. Also, there are no diffusion or vacuum pumps, seals, or gages, and it does away with heating mantles, cold traps, and mercury. Crucibles can be installed without positioning tools or wires. One crucible has a ten-sample life.

To start, the device is outgassed for 10 minutes at 4900° F with the crucible in position. It takes about 25 minutes to establish a working relationship between resistance and the percentage of oxygen.

You don't have to evacuate old gas as each sample is completed. In most cases, it takes only 1 minute to prepare the equipment for the next sample.

Tungsten, zirconium, titanium, and other metals can be processed in the same equipment.

• **Auxiliary Equipment** — A sampling gun is a help in preparing samples. It employs a pistol-like handle and a triggering device which sucks a molten sample into a heat-resistant glass tube. The molten sample crazes the glass making it easy to remove. Samples, called pins, are clean and free of oxides.

Special Heading Wire Solves Problem

Cold forging of recessed-head screws was a problem for Midland Screw Corp.'s Millersport, Ohio, plant, says Frank Upp, plant superintendent.

Heading quality wire, while satisfactory for conventional head types, would split during the manufacture of recessed heads because of the pressure exerted on the head when indented. To meet the problem, a special heading screw wire made by Jones & Laughlin Steel Corp., Pittsburgh, was selected. It withstands maximum deformation in cold heading.

Operation: The wire is first cut to blanks in the header. The first blow upsets the wire and puts the head on. The second blow finishes the head and punches in the cross-shaped indentation. Then the threads are rolled on. Specs on the wire are tight. For example, the permissible tolerance on 0.133 wire is ± 0.0005 .

NOW IT'S UNION CARBIDE METALS

Production Plus: A dependable supply of ferroalloys and metals is assured from six modern plants (three with their own power facilities) and seventeen warehouses.

Product Variety: More than 100 top-quality ELECTROMET brand ferroalloys and metals are available from Company plants such as this at Marietta, Ohio.

Research: The Metals Research Laboratories at Niagara Falls, N. Y. is one of the largest metallurgical research and development centers in the world.

Customer Service: Some of the country's best-qualified specialists in the proper use of alloying materials provide technical service to customers.

COMPANY

Known for over 50 years as

ELECTRO METALLURGICAL COMPANY, we have changed our name to Union Carbide Metals Company. This name will reflect more accurately the close association of this Division with Union Carbide Corporation.

This is a change in name only. The products, the people, and the earnest desire to serve you remain the same.

Our metals laboratories with a 500-man team of metallurgists, engineers, and technicians are carrying out extensive research and development programs in ferroalloys, pure metals, and metal chemicals. Technical assistance and other specialized services are available from our competent metallurgical staff. In addition, Union Carbide Metals Company is backed by the diversified resources of all the other divisions of Union Carbide Corporation. These are only a few of the many reasons why you will continue to get more for your money when you buy the familiar ELECTROMET brand products.

PRODUCTS OF UNION CARBIDE METALS COMPANY INCLUDE

Electromet Ferroalloys and Metals: Boron, calcium, chromium, columbium, manganese, silicon, tantalum, titanium, tungsten, vanadium, and zirconium. Also metal chemicals and metal compounds.

UNION CARBIDE METALS COMPANY

Division of Union Carbide Corporation, 30 East 42nd Street, New York 17, N. Y.

"Electromet" and "Union Carbide" are registered trade marks of Union Carbide Corporation.

These operations can all be tape guided on this vertical boring and turning mill: Feed and traverse of the five-position turret head, ram, and saddle; indexing of the turret, and table speeds. It will machine oil valves

Broader Field for Tape Control Aim of Builders

IF YOU manufacture parts in relatively short runs, chances are you'll be a target of one of the most concerted drives machine tool builders have ever launched.

Reason: Builders know the aircraft industry is sold on numerically controlled machines—now they figure the big market is in other metal-working segments.

- **Case in Point**—Giddings & Lewis Machine Tool Co., Fond du Lac, Wis., soon will deliver a 54 in. vertical boring and turning mill to the Gray Tool Co., Houston, for contour machining valve bodies.

Here are some of the reasons why Gray's management was sold:

Flexibility of tape control will make possible a major reduction in the lengthy setup time required on special oil field valves. This can substantially reduce the leadtime on parts—getting them to the customer faster and boosting Gray's share of the competitive business.

On complex parts, programming and preparation of tapes will be practical even for one-of-a-kind jobs,

with the added advantage that duplicate parts can be reproduced accurately from the stored tapes at any time—even years later. It means that as Gray production men build their inventory of special and standard tapes, leadtime will be even shorter.

Gray managers feel that on long or frequent runs of simple parts, the tape control will reduce setup, machining, and floor-to-floor time substantially. Accuracies and production rates will be predictable, independent of operator skill.

No Panacea

Here is the expert's answer to the prospect who figures that by adding numerical control to a machine, he can tighten tolerances on parts.

Repeatability is boosted: As far as the tape is concerned, if the first part is right, the last one in the run will be, too. But tolerance is primarily a function of the machine itself. If you add tape control to a clunker, you get a tape controlled clunker for a sizable investment, nothing more.

Reliable Wear Tests

GM accurately predicts service performance with properly used laboratory testing

HOW do you evaluate new materials for autos without a lot of road testing?

General Motors Research Laboratories, in telling the SAE about its method of accelerated wear testing, says it relies on two developments: A constant friction machine and a high-unit-load tester.

- **Defines Limits**—Although admitting that such wear testing is frequently an unwanted stepchild, GM believes the developments can be relied on if you thoroughly understand the limitations.

"There can be no universal wear test which will select materials for all wear applications," says Dr. Robert F. Thomson of the research laboratories. But some tests give a preferential order to materials that can be correlated with service.

- **Example**—Laboratory tests of a cast iron cylinder on the constant friction machine showed a 3 to 1 improvement factor over other materials. Subsequent engine tests indicated a 6 to 1 improvement. That illustrates how an accelerated test will often rate materials to match service results.

Constant friction tests also indicated certain aluminum alloys without wear coatings have satisfactory wear characteristics. Road testing confirmed the results.

The high contact load wear test is used for studies of the effects of surface films on wear. Results suggest that surface films may be the factor that controls wear.

- **Caution Advised**—The GM researchers found that there are some occasions when the tests can lead you astray. A sintered powder metal piston ring for diesel engines showed good wear resistance in the lab. (The objective was to inhibit wear with hard particles in the iron matrix.) But road tests showed high wear in the bore. That is why, says GM, performance predictions must include the possibility of change in limiting factors—in this case, something other than wear resistance was involved.

Aluminum balls assure uniform bonding of irregular shapes. Assemblies are cured in an autoclave, then the blanket is removed and balls are recovered with suction equipment

Ball Bonding Technique Improves Aircraft Parts

Equipment can handle up to five 5 by 18 ft assemblies at one time. Components come out with smoother surfaces. Voids, formerly a problem, are now prevented

IF BONDING of irregular shapes is a bottleneck in your plant, you'll want to investigate ball bonding. (Aluminum balls are used to apply uniform pressure.)

It's an effective and economical process used at Twin Coach Co., Buffalo, in making aircraft subassemblies. The company is able to deliver parts to prime aircraft contractors with smoother surfaces, vital to high speed aircraft. Savings are realized through reduced tooling costs, fewer scrap losses, and reduced production time.

• **How the Process Works**—Aircraft

parts are fitted to the master layout of the assembly, then cleaned, surface treated, and coated with liquid adhesive. A tape component of the adhesive system is applied to the parts being bonded. Components are then tacked together by heating.

Each assembly is laid out on a metal surface, called a platen, and covered with $\frac{1}{4}$ in. aluminum balls. Coated with a silicone based parting agent, the balls won't stick to the bonding adhesives.

Platens are covered with a layer of asbestos and an autoclave blanket. After blankets are checked for vacuum leakage, assemblies are

placed in an autoclave for curing. The equipment handles as many as five 5 by 18 ft assemblies at once.

The curing process is a critical one. Temperatures of 325 to 350° F, and pressures of 45 to 200 psi are applied, depending on the assembly. The components are then inspected, trimmed to size, painted if necessary, and delivered to the final assembly area.

• **Use Extended Since '55**—Twin Coach began research on the technique in 1955. Now the method is being used for all types of bonding. Materials bonded: aluminum to aluminum, aluminum to magnesium, and fiber glass to aluminum.

• **Problems in Bonding**—Before development of the new technique, bonding of irregularly shaped parts was a major problem for aircraft manufacturers. Adhesion of metal surfaces was often spotty.

Voids often appeared, weakening the components. They sometimes appeared as bubbles and gas pockets, making surfaces of parts irregular. That caused air friction and turbulence.

Acme-Gridley, 1 1/4" RB 8 producing 690 nozzle bodies per hour

Close-up of tooling zone showing 5th, 6th and 7th positions.

ACME-GRIDLEY ELIMINATES SECONDARY OPERATIONS...

for Eagle Manufacturing Company

- Direct Cost Reduced 48%*
- Production Time Reduced 64%

* Details on request

**NATIONAL ACME'S
"ZONE OF RESPONSIBILITY"
INCLUDES ALL PHASES
OF COST REDUCTION**

Check YOURS...Then Check National Acme

As a part of a continuing contribution to all phases of cost reduction, National Acme engineers initiated the development work necessary to effect important savings for this 65 year old Wellsburg, W. Virginia company.

The aluminum nozzle body of their hydraulic pump oilers formerly had been produced on a six spindle automatic and two other machines performing secondary operations. Visionary machine tool engineering made possible the application of spindle stopping and positioning on an eight-spindle Acme-Gridley to complete the entire piece in the primary set-up . . . and increase net production.

Advanced design and development such as this, together with wide open tooling zones, independently operated tool slides and the extreme accuracy and flexibility of direct camming . . . makes possible the solution of "unusual" jobs an "every day" occurrence at National Acme.

Write or ask one of our representatives for the complete story on the industry's most modern approach to your cost reduction problem.

Direct Costs: these include direct dollar savings as realized by the Eagle Manufacturing Company . . . an "every day" job for Acme-Gridleys.

Indirect Costs: effecting important savings in maintenance, downtime, scrap reduction, tool costs, etc.

Product Redesign: teaming with your design group to take full advantage of Acme-Gridleys' cost reducing capabilities.

Direct Material Costs: our engineers provide important savings in this area by constantly matching machines and tools to modern metallurgical problems.

Make-or-Buy Reviews: in many cases our Contract Division can assume your production headaches and relieve you of immediate capital investment.

Spot Modernization: pioneering in modern tooling methods, and the flexibility of Acme-Gridleys can provide many "on-the-spot" savings.

Vanadium Eyed for Use in Reactors

Purer forms are ductile, have good thermal properties, will not alloy with uranium

VANADIUM IS finding its place in the growing reactive metal group. Some commercial producers are making it. Several applications are promising.

The metal may be used as a fuel element cladding material in nuclear reactors. It is being considered because it has good thermal conductivity and will not alloy with uranium. Good formability and unusual diffusion properties have prompted its consideration (in sheet form) as a diffusion barrier when cladding steel with titanium.

● **Properties** — Pure vanadium is soft, ductile, has a relatively low neutron cross section, and has excellent corrosion resistance. Impurity levels are critical, particularly for oxygen, nitrogen, hydrogen, and carbon. A few hundredths of 1 per cent difference can change it from a ductile to a brittle metal.

Resistance to hydrochloric and sulfuric acid is probably as good as that of any metal. It is said to withstand aerated salt water attack better than most stainless steels but not as well as titanium. Resistance to dilute caustic solutions is fair. It cannot withstand dilute or concentrated nitric acid.

● **Fabrication** — Vanadium of reasonable purity can be hot worked easily, but an oxide forms rapidly above the oxide melting point (1225° F) and requires special handling. Below 1225° F the oxide is tight, adherent, and self-protective. Levels of impurities, particularly oxygen and nitrogen, affect hot or cold workability.

Malleability has been demonstrated by severe cold working. Foil less than 1 mil thick has been rolled without intermediate annealing, and it is expected that wire can be drawn to less than 15 mils in diameter. Wire rod is cold swaged without difficulty.

Welding is practicable, but only

CONVENIENT, QUIET, SAFE

The New Hevi-Duty Electric Resistance Holding Furnace

The holding furnace brings a new degree of speed, convenience and safety in the production of aluminum castings . . . and a new high in metal quality, too. There is no turbulence, no noise and a minimum of dross formation. It holds metal overnight, or over a weekend if necessary. The unit is extremely compact and unusually cool to work with.

Further, it is simple to service. Resistance elements can be replaced while furnace is in operation. If charge freezes due to power failure, it can be reheated without damage to furnace. There are no pots to break or replace. Linings last for years under normal conditions and are standard brick shapes — available locally.

Find out how its quiet efficiency can aid your operation. Call your Hevi-Duty representative or write for Bulletin 150.

- Industrial Furnaces electric and fuel
- Laboratory Furnaces
- Dry Type Transformers
- Constant Current Regulators

by protecting the molten zone from the atmosphere. Heliarc welding and similar methods have been used, but working in an enclosure having an inert atmosphere is the most satisfactory method.

• **Vanadium Alloys**—Comparatively little has been done in the study of alloy combinations. Titanium seems to be the most promising alloying element for improving vanadium base alloy strength, both at room and at elevated temperatures. The strength-to-weight ratio up to 1200° F and good formability are among outstanding qualities studied so far.

Chromium, aluminum, and zirconium show promise as ternary alloying elements. Such alloys might be considered for airframes of high speed aircraft.

Device Records, Controls Carbon Content in Gases

A NEW concept is applied in an automatic carbon potential controller, called the Rolock, announced by Rolock Inc., Fairfield, Conn. It's used with endothermic gas generators serving controlled atmosphere heat treating and carburizing furnaces.

Victor Kappel, president of Connecticut Gas Atmospheres, who designed the compact equipment, says the operating principle could be adapted to control of any combustible gas.

The sensitive device measures and records temperatures at a single point inside a small flame, burning a sample of the gas under constant pressure and with constant volume.

For each carbon potential of the sample gas, there's a corresponding flame temperature to which the Rolock can respond.

Close limits are easy to maintain. In closed control circuit with furnaces or gas generators, constant monitoring and immediate adjustment are assured if the gas generators can hold carbon level within a reasonable range.

It replaces more complicated controllers. A trained technician for operation is not needed if it is properly installed and calibrated with furnace or gas generator conditions.

METALLURGY

is a **SPECIAL** service

at **Alan Wood**

Practiced as a true science at Alan Wood, **METALLURGY** controls production . . . to the advantage of all customers. Your Alan Wood Representative understands these advantages and how they can increase your product's quality. For example, he may suggest a metallurgical study of your situation. He has complete information on cold

rolled steel and its applications, and his advice on type, gauge and size to order can help you eliminate production problems . . . cut costs . . . increase profits.

Empire Steel Casting's new bay for cleaning large castings is fed from the main floor by jib crane. Transfer within the department is by overhead monorail. After chipping and grinding, the conveyors feed the castings back into the main bay

Foundry Cuts Costs with Modern Handling Methods

Sweeping modernization program takes in handling of raw materials; in-process movement of carbon, alloy, and stainless steel castings; metal and molds

LOOKING for ways to reduce production costs? The best place to start is at basic sources of high costs.

One is material handling. It cuts across all metalworking, but is particularly a problem for foundries. One firm, Empire Steel Castings Inc., Reading, Pa., found the answer in complete modernization

of its handling methods in all phases of production.

Three objectives were realized:

1. All nonproductive storage and material handling were removed from the foundry.

2. Premium molding facilities (shell and stainless steel) were built into former waste storage

space and new building extensions.

3. Handling costs were reduced and production increased.

Management at Empire feels the modernization program will put the company in a more favorable competitive position in the expanding market for premium castings which is expected this year.

• **Broke a Bottleneck**—The company produces sand and shell molds for small (under 50 lb), medium (50 to 100 lb), and large castings. Much of the work is in small and medium products.

Material flow to and from all stations was the big bottleneck. To break it, the foundry built new molding and pouring departments, conveyORIZED cleaning lines, took all unnecessary operations and equipment out of the foundry, mechanized supply handling operations, and added more mechanical aids.

Shell molding (in background) and sand molding use the same mold setout tracks. The only hand transportation in the foundry operation: Shell molds are carried a few steps to the top of the setout line

Loading and unloading of the annealing furnace are also mechanized. A fork lift truck picks up the hot casting and lowers it into quenching tanks set in the floor

• **Move Was Necessary** — MacCormick G. Moore Jr., Empire's president, feels his modernization program was necessary merely to stay competitive. "Customers are writing tougher specifications that require more testing and improved controls. To provide superior alloy and stainless steel castings at fair prices, we must make foundrywork easier so each man works more efficiently and productively."

Efficient material handling starts in the purchasing department. All supplies that can be shipped palletized are ordered that way. Everything but scrap and sand is handled by fork lift trucks and stored in the blacktopped yard or in a new warehouse. Flasks and finished castings are palletized and stored in the yard to keep the foundry free and uncluttered.

With the installation of a magnetic crane, furnace charges will

Empire hardtopped its yard to permit outdoor storage of finished castings, flasks, and raw materials. By adding a crane, the foundry can make up furnace charges outdoors

NEW This is the ~~old~~ grind at ALLEN

A quarter of a million square feet of space in the great new Allen plant is devoted to precision fasteners — and much of it houses batteries of the latest, high-speed automatic centerless grinding equipment. Here you see a close-up of the grinding section set up to produce dowel pins at the rate of one a second per machine.

Allen's vast new facilities assure constant standards of uniformity, accuracy, strength and fit, many of which are duplicated nowhere else. Now there's more reason than ever to make Allen *your* Buy-Word for socket screws, keys, pipe plugs and dowel pins.

Speaking of dowel pins — specify *Allen* for great strength where you need it most. Made of Allenoy steel, they're surface hardened to 62-64 Rockwell C. Core hardness 47-53. Case depth .010" to .020". Shear strength from 160,000 to 180,000 psi. Precision-ground to $\pm .0001$ ", with a mirror finish of 6 RMS max.

In stock at your Allen Distributor . . . in diam. from $\frac{1}{8}$ " thru 1" . . . lengths from $\frac{3}{8}$ " thru 6". Also in two standard oversizes — .0002" for press fit, .001" for repairs. For more details, ask your local Distributor, or write directly to the Allen Manufacturing Company, Hartford 1, Conn.

be made up in the yard and moved by truck. Scrap and pig iron are stored in open bins that flank the railroad siding. That minimizes unloading time.

- **Extra Space Gained**—An addition was built on the main foundry bay to gain space. It was used to expand the molding facilities for stainless steel.

A shell molding department was established with hoods over the equipment to remove fumes, and a sand molding area for stainless was set up. Both molding operations use the same dual-rail tracks to feed the molds to the main pouring area.

- **Cleaning Conveyorized** — After pouring and shakeout, the castings go to one of six cleaning lines (three roller conveyors for light castings and three for medium castings). Heavy castings are sent down the main bay by crane. A new auxiliary cleaning line off the main bay is fed and emptied by jib cranes.

Once castings are in the auxiliary bay, they move along on the roller conveyors. Jib cranes are used to move castings to work stations.

Jib cranes that service all cleaning stations in the main bay eliminate time wasted in waiting for overhead crane service.

- **Truck Handling**—Tote boxes of small and medium castings are moved from shakeout by lift trucks. After tumbling and shotblasting, the castings are again transferred by truck to the cutoff area at the head of the roller conveyors.

Risers and gates are removed by abrasive wheel or torch. Castings are then tossed into carrier boxes on the conveyor. Boxes pass along the main conveyor until diverted to grinding stations, then farther along conveyor lines through chipping and dressing operations.

- **Heat Treatment**—All the lines, roller and main bay, end at the heat treating department. Carbon steel castings are normalized in a gas fired, car type furnace.

A new, high temperature, gas fired car-type furnace just starting operation will expand the heat treating capacity for stainless steel and low alloy castings. Special alloy castings may also be heat treated in two additional gas fired ovens.

Routers Machine Nonferrous Metals at High Speed

YOU CAN machine aluminum, magnesium, and other nonferrous metals at high speed with the Models 1024 and 1036 heavy duty routers. Features of the machines include modern design, easier tooling and setup, simplified operation, extra strength, and lower maintenance costs.

The entire machine stand (bed, column, and over-arm) is a one-piece Meehanite casting. Its massiveness and rigidity assure maximum routing accuracy. Control of the machine is centered in a pushbutton station on the front with a selector switch for operation at 10,000 or 20,000 rpm spindle speed. The drive motor and an electric spindle brake for quick stopping are coupled to the stop button.

A new, large size table provides ample room for setup and work feed. Tables are adjustable for vertical height positioning. An optional table design provides tilt up to 45 degrees.

A foot control lowers or raises the router head for vertical feed to the work. Air pressure for actuating feed is controlled by a pedal.

Other design details include a spindle lock for easy mounting of arbors and chucks, an air nozzle to keep the work free of chips, and a vacuum pulley drive to give positive transmission of drive motor power and speed to spindle.

For more information, write Machine Tool Div., Onsrud Machine Works Inc., 7720 Lehigh Ave., Niles 48, Ill.

Universal Milling Machine Adjusts in Three Planes

BECAUSE of its versatility in worktable plane adjustments, sensitive range of cutter speeds, and fast tooling setup, the Model UF-2 milling machine is ideal for shopwork on die cavities or machine components.

An earlier model has become invaluable to a large eastern aircraftmaker. Ease of conversion from slotting to horizontal or vertical milling has saved time and money in one-of-a-kind machining operations.

Special features of the unit: Its 36 spindle speeds ranging from 33 to 2176 rpm; nine feeds spaced from 15/32 in. up to 10 in. per minute with a fine boring feed adjustable down to 0.0002 in. per revolution; rapid traverse for the horizontal milling head and for the vertical and longitudinal table motions.

The 42½ x 15¾ in. worktable can carry a workpiece weighing up to 2000 lb if the piece is kept close to the column. Work up to 1400 lb can be accommodated in the extreme overhanging position without distorting or overloading the machine.

For more information, write Carl Hirschmann Co. Inc., 30 Park Ave., Manhasset, N. Y.

beautiful
products

from CONTINENTAL® WIRE

The beauty and smooth operation of fireplace curtain screens depend on accurate forming, even spacing, and neat appearance of the mesh. The wire used must be of correct temper, diameter and finish. Uniformity of these properties is of prime importance. Leading fireplace equipment makers choose Continental Wire because it possesses these features dependably, in coil after coil. The ability to take intricate forming is an important reason why Continental Wire is specified for scores and scores of other products made with wire. Continental Curtain Screen wire, 19 gauge through 20 gauge inclusive in size, is available in 500 pound to 650 pound catchweight single length coils packed in Leverpac Drums for faster weaving with less down time, cleaner handling and better storage. For wire in practically any size, finish, temper or analysis, in low or medium low carbon steels, see Continental first!

Band Sawing Machines Have Extended Tables

TO FACILITATE large, awkward band machining operations, DoAll Co. is offering an extended-table model in each of its lines of vertical band machines.

Designated by the suffix HB, the machines have an effective working stroke of 41 in., and will move a 1-ton workpiece at any feed rate from 1.5 to 96 ipm.

All of the HB model units incorporate a new feature: The saw band can be changed without disturbing the setup. The total travel of the table is 9 in. more than its effective working travel. At any time during a cut, the table may be withdrawn to its extreme position. This uncovers a gap in the table bed that allows easy access to the

Saw Cuts Hard Metals

POWERED by a 7½ hp continuous duty motor, this cutoff saw handles the hardest metal with high speed and accuracy.

It cuts ferrous and nonferrous metals at a rate of 2 to 4 seconds per square inch to tolerances of less than 0.010 in. leaving a milledlike

finish that often eliminates subsequent operations. It produces no change in characteristics or hardening of metals.

The Model M-750, is available for manual, semiautomatic, and automatic operations. For more information, write Stone Machinery Co. Inc., Manlius, N. Y.

Coil Receiver Doubles Slitting Line Capacity

INTERRUPTIONS for banding in slitting operations are eliminated with this coil receiver. Instead of banding coils on the slitter reel, coils are pushed on to the hydraulically operated coil receiver, then

(Please turn to Page 151)

wung out of the way while the operator slits another coil.

When banded, the coils can be pushed off the coil receiver one at a time or all at once. The unit is available in sizes designed to accommodate the strip from any plant's recoiler.

For more information, write Paxson Machine Co., Salem, Ohio.

Truck Handles Small Loads

IG JOE Model 299 lift truck is built for in-between handling jobs. It will lift 1000 lb loads to 57 in. Large companies can assign the truck to individual departments to provide immediate handling throughout the plant. Smaller industries can save on labor and improve production through the use of the unit.

The truck is equipped with a 12-

Hard Facing Material Adds Wear Resistance

HARD FACING with sprayed tungsten carbide at 90 per cent deposit efficiency is possible with a spray-powder material.

Carbide concentration in the coating is high. Coatings are torch fused after spraying. The close control of coating thickness plus the comparatively smooth surface minimizes finishing.

The process is recommended for parts subject to extreme wear conditions, such as buffing fixtures, sanding templates, polishing masks, tool joints, and metal patterns.

For more information, write Metallizing Engineering Co. Inc., Westbury, N. Y.

Heat Transfer Units Offer Better Media Distribution

FAST heat-up of plating tanks, process tanks, and similar applications is possible with the Multi-Zone Platecoil units. A unique arrangement of headers and passes speeds the job.

Better distribution of the steam (or other heating media) is achieved through the use of three headers (branches of the main feed line entering the unit). The headers supply steam directly to a bank of horizontal passes.

The Platecoil unit consists of two

the same drum.

The *metal degreasing* grade of
Nialk® trichlorethylene meets indus-
trial specs for flushing missile and
rocket components. Its residue count
is a low 0.0005%. It meets impact
sensitivity requirements.

Save storage space. You can cut
inventory to the bone with this single
grade of trichlor. The savings in time
and money are obvious.

Eliminate mistakes. There's no
chance of picking the wrong drum to
do a job when you stock just one
grade for all work.

No disposal problems. Take the
same trichlor you use for flushing and
you can use it in your vapor degreaser
without distilling.

Get psp too. Get the extra advan-
tages of **psp**—permanent staying
power—in your trichlor. See box at
right for details.

Send for bulletin. Data Sheet 814
should answer any questions you have
about Nialk trichlor. Write for a copy.

DOES YOUR SOLVENT SOUR?

1. Trichlor is protected by
stabilizer against heat, air,
light, moisture, acids, and
active metals.

2. Ordinary stabilizers wear
out during use, making it
necessary to titrate and add
fresh stabilizer.

3. A sour solvent can even
stain metals instead of clean-
ing them; affects bath opera-
tion, too.

4. Nialk has **psp**... perma-
nent staying power. Always
gives you full protection.
Never goes sour.

HIGH PRESSURE LOW COST

This 8 pound Meehanite Metal casting made for the Joy Manufacturing Co. by Hamilton Foundry is a fourth stage air compressor cylinder. Pressures build up to 6,000 p.s.i. and require a high strength, pressure tight and wear resisting casting. Alloyed Meehanite®, oil quenched and tempered, raised Brinell hardness of the cylinder wall to 275-300, and increased tensile strength to 60,000 p.s.i. Meehanite was chosen for this casting because controlled structure and small uniform flake graphite produce pressure tight castings of uniform density and strength.

Manufacturing costs drop when uniform, high quality castings go through production. In this case, Meehanite castings from Hamilton Foundry give Joy tight control on finished parts costs by combining dimensional accuracy, uniform machinability, a low rejection rate, and delivery on schedule. Pressure tightness, long service life and fine surface finish insure Joy's reputation for product quality.

When new and unusual design problems arise in the selection of metal and the casting of parts, you will find that the skill and integrity of your foundry is your best insurance that specifications—and delivery schedules—will be met.

NEW PRODUCTS and equipment

embossed metal sheets that are spot-welded to form channels for the passage of heating media. They are available in mild steel, stainless, Carpenter 20, Monel, Hastelloy B and C, and nickel.

For more information, write Platecoil Div., Tranter Mfg. Inc., Lansing, Mich.

Flame Detecting Unit Uses Ultraviolet Tube

THIS detection device can be used on all types of industrial heating or processing burners. Since it is sensitive to ultraviolet light, it works equally well with all fuels, including gas-oil combinations.

A self-contained system, the unit has an ultraviolet-sensitive tube that works with an amplifier circuit. It is not affected by hot refractories, incandescent light, hot metal parts, or flickering radiation in the visible or infrared regions.

The manufacturer says the device makes some detection applications possible for the first time, such as exothermic gas generators, radiant cup burners, and flame hardening machines. It can be used to sight temperatures up to 2200° F without any back light effect.

For more information, write Merchandising Dept., Minneapolis-Honeywell Regulator Co., 2747 Fourth Ave. S., Minneapolis 8, Minn.

Pneumatic Power Unit Does Milling, Drilling

TWO basic air motors can be used in these pneumatic power and feed units to do reaming, tapping, boring, facing, milling, and drilling.

The feed unit contains its own air motor with adjustable speed control. Automatic stop and return features are built in. The feed unit can be started by a small lever on the right of the machine, or by remote control. By connecting a three-way air valve to the housing, you can provide simultaneous operation for any number of units.

The line provides a range of speed

STEEL

Bearings, Inc.

designs and supplies anti-friction bearing conversion units for many applications

This sliding, take-up unit is installed on textile mill equipment. It illustrates one of many clean, practical fixtures our bearing engineers have designed to hold the bearings best suited to carry shafts with a minimum of maintenance and with low power consumption. Our customer is pleased with the success of this installation in cutting operating

costs, improving quality and increasing production. Your request for a Bearings, Inc. engineer to survey your machinery and recommend anti-friction bearing conversions where practical, will be promptly answered. It's a service we're glad to perform at no cost to you.

and torque from 20,000 rpm at 12 lb to 200 rpm at 1440 lb. For more information, write Automation Tools Inc., Box 331, La Jolla, Calif.

Universal Speed Reducers

YOU CAN mount these universal, worm gear, speed reducers in three different positions: Wormshaft below the gear, wormshaft above the gear, and with outputshaft vertical.

Cost of horsepower has been reduced by using a one-piece cast iron housing with external fins for cooling and an aluminum radial fan which directs air over the fins.

For more information, write Dept. PR, Link-Belt Co., Prudential Plaza, Chicago 1, Ill.

Volatilizing Flux Eases Brazing Problems

HARD-TO-BRAZE materials, such as A 286, 17-7 PH, and Inconel X, can be brazed in hydrogen or dissociated ammonia with Vapo-Flux.

It volatilizes during brazing, leaving no residue. It aids wetting and flow of the brazing alloy. Special surface preparation, such as leaching, etching, or plating, can be eliminated.

It comes as a powder for mixing with powdered brazing alloy and Microbraz Cement, or in solution for coating surfaces before applying the brazing alloy.

For more information, write Wall Colmonoy Corp., 19345 John R St., Detroit 3, Mich.

Corrugated Box Printer Cuts Costly Inventories

VALUABLE storage space can be saved and costly inventories of boxes eliminated with the Pannier automatic knockdown corrugated box printer.

It will print the entire carton or will imprint code, product identification, sizes, and similar information on preprinted boxes to accommodate a day's requirements. It

STEEL PIPE BY WHEELING

One section of Wheeling's ultra-modern pipe warehouse.

With Wheeling Steel Pipe, YOU KNOW!

You know you're right when you use Wheeling Steel Pipe. That's because only steel pipe combines economy and dependability with superior mechanical strength.

What's more, you'll always get prompt delivery on Wheeling Steel Pipe. For Wheeling has just completed a \$5½-million program to

expand and improve its pipe making, warehousing and shipping facilities. *Wheeling can serve you better than ever before!*

Get the story on Wheeling Continuous Weld Steel Pipe, both black and galvanized, from your Wheeling representative this week. Wheeling Steel Corporation, Wheeling, W. Va.

Why Wheeling Steel Pipe is First Choice!

- Lowest cost with durability
- Strength unexcelled for safety
- Formable — bends readily
- Weldable — easily, strongly
- Threads smoothly, cleanly
- Sound joints, welded or coupled
- Grades, finishes for all purposes
- Available everywhere from stock

WHEELING STEEL CORPORATION • IT'S WHEELING STEEL! District Sales Offices at Atlanta, Boston, Buffalo, Chicago, Cincinnati, Cleveland, Detroit, Houston, New York, Philadelphia, St. Louis, San Francisco. Wheeling

Mountain View Dairies, Long Beach, Calif., operate this compressor 12 hours a day. There have been no breakdowns or maintenance on the Gates Vulco Rope Drive since it was designed years ago. Mr. Fred Hiller, Vice-President, reports, "It has never given us a moment's trouble."

The No. 1 choice of industry everywhere ...the V-belt with concave sides

To prove to yourself why concave sides give this V-belt far longer life, make this simple test: bend a Gates V-Belt as if it were going around a sheave. Feel how the concave sides (Fig. 1) fill out... become perfectly straight (Fig. 1-A).

Note how the belt makes full contact with the sides of a sheave... grips evenly, thus distributing wear uniformly along the sides of the belt. Uniform wear lengthens belt life—keeps costs down.

With a straight-sided belt (Fig. 2) the sides *bulge out* when the belt is bent, and wear is concentrated on the bulge (Fig. 2-A). Uneven wear shortens belt life—increases belt costs.

Because Gates V-Belts with concave sides are so universally preferred, they are the *most widely available*. There are Gates Distributor stocks in industrial centers *throughout the world*.

also can be used to print cartons one at a time as needed for production line filling.

The machine will handle cartons up to 21 x 32 in. and will deliver 2400 impressions an hour. For more information, write Pannier Corp., 527 Sandusky St., Pittsburgh 12, Pa.

Belt Booster Is Portable

THIS CONVEYOR is easily rolled into position for horizontal, low incline, or 30-degree incline use.

Once in place, a rubber cushioned stabilizer automatically anchors the unit in place. It has a removable front row roller or wheel feeder sec-

tion that lifts out to minimize the risk of injury should hands get in the pinch-point between the belt and feeder section.

It is available in 11 and 13 ft lengths with 12 in. wide, three-ply belts that travel at 45 fpm. For more information, write Harry J. Ferguson Co., West Avenue, Jenkintown, Pa.

Tool Grinder Works to Precise Gage Accuracy

SINGLE point cutting tools can be made more productive with the Micropoint tool grinder.

It grinds tool profiles geometricaly correct to precise gage accuracy with either conical or cylindrical relief at the radius, and can handle any tool up to a 1-in. square shank.

The possibility of human error is reduced by direct dial settings which provide a method of fast, simple, and accurate adjustments for radius, cutting angle, offset, and clearance.

Accurate blending of the radius into the flats of the lead and end

"even a little man can move a Sterling"

40% less lift 60% less push

• Smooth rolling Sterling barrows require a minimum of energy... even a little man can move 'em. Tests recently completed with three makes of wheelbarrows, each loaded with 320 lbs. of sand, show Sterlings require 40% less vertical force and 60% less horizontal force... an amazing performance record. The actual figures are shown at right.

	Vertical Force Required	Horizontal Force Required
Wheelbarrow "A"	125 lbs.	22 lbs.
Wheelbarrow "B"	128 lbs.	20 lbs.
Sterling Barrow	77 lbs.	8 lbs.

• Yes — it pays to spend a few dollars more for easy rolling STERLING barrows. Write for catalog.

cutting edges gives a tool profile that enhances the size and finish of the machining operation.

For more information, write DeVlieg Machine Co., Fair Street, Royal Oak, Mich.

Cleans Parts Ultrasonically

IDEAL for use by manufacturers of small, precision parts, the Econo-Sonic unit precleans, ultrasonically cleans, and pressure-spray rinses.

Complete with a distillation and filtration system, the unit provides all the facilities needed for cleaning in its work-size capacity.

For more information, write Dept. R2, Detrex Chemical Industries Inc., Box 501, Detroit 32, Mich.

Titanium Plating Hooks Resist Corrosives

TITANIUM anode hooks and baskets have been developed to meet the critical need for corrosion resistant fixturing in nickel and chrome plating operations.

The titanium hooks can be submerged in the acid, allowing even dispersion of the nickel plate, and sharply reducing nickel scrap loss and recovery costs.

Hooks and baskets are available in standard sizes and shapes. For more information, write Mallory-Sharon Metals Corp., Niles, Ohio.

Power Saw Has Selection Of Work Handling Devices

A WIDE combination of work handling equipment is available with the DoAll Model C-24 cutoff saw to adapt it to many applications.

The horizontal type machine cuts material with the top portion of the saw band. This makes possible a powerful and rigid design for fast, efficient, and accurate cutoff with low material waste.

The basic machine has a roller table on the load side of the saw band with or without powered rollers. Powered conveyor tables can be added to either side of the

**Man with motion
in mind**

"The Man from Logan" is challenged by the problem of *motion* every working day. Materials handling encompasses the total aspect of motion; direction, speed, and timing of materials moved over a conveying system. "The Man from Logan" is equipped to diagnose and design the *exact* system to fit the demanding needs of small and large users.

Behind the versatility and training of "The Man from Logan" is the company itself. For two generations the Logan Co. has been a name synonymous with quality, performance and dependability.

If you have a problem in the handling and conveying of your materials, why not talk to "The Man from Logan"? A letter or phone call will bring him to you right away.

Logan Conveyors

LOGAN CO., 535 CABEL ST., LOUISVILLE 6, KY.

The **DOUBLE IMPACT...** of a UDYLITE IDEA

Project Alert, as a philosophy of re-awakening, of renewed enthusiasm, of mental alertness, has shown wonderful results since its initiation last fall. Many organizations have asked us for supplies of Project Alert folders and buttons so that they may introduce it to their people. Leading magazines and newspapers, too, have given Project Alert splendid support.

1. Project Alert, as a sound product promotion, has worked because each of the three product presentations has included a true specialized service, an economically sound value, and a new product.

Like the product presentations still to come, they are based entirely on *customer benefit*. Customer recognition of these values, measured by their response, has been excellent.

2. Adoption of the philosophy to your own organization will help you as surely as it has helped others. And keeping your eye on Udylite product presentations and their sincere true value offerings can only add to your profits.

If you want to adopt the Project Alert philosophy, we'll be glad to help you. And if you haven't seen our Project Alert product presentations, we'll furnish you copies on request.

Ask your Udylite sales representative, or write direct to us in Detroit

Join the PROJECT ALERT CAMPAIGN now!

curacy to tenths, simple three-step abrasive change, automatic dressing and sizing, centralized lubrication, improved coolant system through the spindles.

The machine can handle any part with two flat surfaces of nearly equal area which must be parallel to each other. It grinds steel, cast iron, nonferrous metals, carbides, ceramics, and plastics.

For more information, write

Besly-Welles Corp., 120 Dearborn Ave., South Beloit, Ill.

Barrel Unit Plates 23,000 Parts an Hour

THIS continuous plating barrel has an hourly output equal to about four batch barrels, and needs attention only for feeding parts and removing the plated work from a tote box.

In one installation, the barrel chromium plates 23,000 parts an

hour. Each part is about $1 \times \frac{1}{2} \times \frac{1}{8}$ in.

The unit is designed so that dry and burnished parts are introduced into one end of the machine and are fed automatically into the barrel which has specially designed baffles to preclude contact marks.

Timing of the barrel is automatic and can be adjusted for thickness of plate and number of parts.

For more information, write Metal & Thermit Corp., 100 Park Ave., New York 17, N. Y.

**ABELL-HOWE
COMPANY**

Forest Park, Illinois

Welding Fixture Is Flexible

THIS manipulator for automatic welding provides maximum flexibility of movement. It consists of a vertical mast and horizontal boom mounted on a pedestal or cylindrical base.

The boom travels 10 to 150 ipm horizontally, and 12 ipm vertically. It has a maximum clearance of 42 in. and provides an effective weld length of 42 in. The mast will pivot 360 degrees and can be locked in any position.

The company also has a new turntable positioner with a load capacity of 500 lb. For more information, write Miami Specialties Co., Trade Road, Troy, Ohio.

Salt Removes Rust, Scale

YOU CAN remove rust, scale, and black oxide from steel with Striplite, a nonacid salt which will not attack the base metal.

The salt is dissolved in water at a ratio of 1 to 4 lb per gallon, and the solution is used at 180 to 212° F. If necessary, it also can be used electrolytically. Activity of the solution is proportional to its strength, temperature, and the presence or absence of electric current.

For fast work, cyanide can be added to the electrolytic bath, but caution must be observed.

For more information, write Du-Lite Chemical Corp., Middletown, Conn.

Burring Machine Raises Operator Output 65%

PRODUCTION costs can be lowered and valuable time saved by a high speed, highly accurate burring machine.

One application is rapidly reduc-

ing any small weld flash to the dimension of the joined metal. It can also be used for smoothing burrs from machined parts or cleaning out comparatively inaccessible places, such as casting slots.

The high speed has resulted in increases in operator output up to 65 per cent. The machine is quickly set up for each production run.

An adaptation of the Rouse hand miller, the machine is set up for burring by stepping up spindle speed to 10,000 rpm, attaching a high speed carbide burr to the output shaft, and adapting a fixture to accommodate the piece.

For more information, write H. B. Rouse & Co., 2214 N. Wayne Ave., Chicago 14, Ill.

Attachment Makes Rotary Milling Possible

USEFUL with horizontal or vertical milling machines, this rotary head attachment has three exclusive features:

1. Direct drive by V-belt from motor to spindle with a choice of six speeds.
2. Double rotary worm shaft, with a front shaft for smooth,

exacting rotation, and a rear shaft for fast head rotation.- 3. Cross-slide screw which offsets the spindle from either end of the slide.

The attachment rotates 360 degrees in either direction, and the cross-slide adjustment offsets the spindle up to 3 5/8 in.

For more information, write Everede Tool Co., 2000 N. Parkside Ave., Chicago 39, Ill.

Dual Spray Machine Doubles Production

A PRODUCTION increase in painted parts of 200 to 500 pieces per hour is possible through the use of a double, vertical fixture, automatic spray machine.

It enables one operator to turn out more work than can be done by two operators with hand sprayers. The machine is designed for fast, perfect finishing of one, two, or three surfaces of generally oval or rectangular shaped pieces of

varying length where fine mask definition and paint demarcation are imperative.

The operator loads one station while the machine is painting in the other. The equipment is ideal for use with a fast conveyor. A new wrist-action device allows the overhead traveling spray guns to be tilted in one or two directions. Square shaft vertical fixtures alternately lower and raise the part, placing it snugly in the mask for painting.

For more information, write Conforming Matrix Corp., 345 Toledo Factories Bldg., Toledo 2, Ohio.

**"We
can
see
the
SAVINGS"**

since we switched to Wheelabrator® Steel Shot™

A single pound of Wheelabrator Steel Shot, as shown in the hands of Mr. R. L. Smith, Forging Engineer at the Broderick Co., Division of Harsco Corp., Muncie, Indiana, cleans the forgings shown in the large pile. The same quantity of malleable abrasive formerly used could clean only the quantity represented by the small pile.

"The same cleaning production is handled in half the former time with 57% less abrasive," says Mr. Smith. "While cleaning production increased from 275 tons to 642 tons of forgings per ton of shot used, abrasive costs were reduced 43%."

And as a bonus benefit, blasting with Wheelabrator Steel Shot has improved the surface appearance of Broderick's forgings, adding to their customer's satisfaction.

Your Wheelabrator Abrasive Engineer will help you make similar savings in your blast cleaning operations. Write for details of this blast cleaning efficiency engineering service.

NEW BOOKS

Welding Type 347 Stainless Steel Piping and Tubing, George E. Linnert, American Welding Society, 33 W. 39th St., New York 18, N. Y. 103 pages, \$3.50. Type 347 stainless has been generally regarded as nearly foolproof and one of the more dependable grades, particularly in welded applications. Recently, difficulties have been reported in welding Type 347 piping and tubing. This Welding Research Council report is a comprehensive review of available information on the steel. The main portion of the report is devoted to welding procedures and joint properties.

March 2, 1959

Steel Shipments Slated for Big Jump

FINISHED STEEL shipments will top 7 million tons this month, giving consumers their first real chance to increase inventories since the recession ended. Not since June, 1957, have shipments been so high. In recent months, they've barely exceeded consumption. As a result, users have had little opportunity to replenish their stockpiles. There has been only a modest buildup since October, when inventories bottomed out at 12 million to 13 million tons. From now until June 30, users will take in more steel than they'll use. By midyear they'll have 21 million to 22 million tons (see Page 170).

NO LETUP IN SIGHT— Consumers are pressing for everything they can get before July 1. A few weeks ago they were trying to line up April and May deliveries, hoping to keep storage and finance charges at a minimum. Now they're asking that orders be shipped immediately. Chances of having deliveries speeded up are poor. Most mills are fully booked on flat-rolled products, and few have open tonnage in oil country goods, bars, plates, or structurals. Chicago steelmakers are allocating all their products. They're sold out on wide flange beams but still have second quarter space for standard shapes.

SERVICE CENTERS SALES UP—In most sections of the country, sales by steel service centers were up last month. The gains were none too impressive in New York and New England, but shipments of midwestern distributors rose 15 to 30 per cent. Warehouses are getting more "hurry up" orders as their customers step up production. At present, little of the buying at service centers is aimed at inventory building.

STRUCTURAL JOBS SPEEDED—The possibility of a midyear steel strike is accelerating the planning and placing of structural contracts in the East. Many of the big fabricating shops have labor agreements that expire when the mill contracts run out. Fabricators whose contracts don't expire until later have other worries—how to get shapes and plates during a strike, for instance. Builders and architects are speeding up work where they can, bearing in mind also the probable effects of labor demands on costs. In cases where engineering work isn't far advanced, projects may

be suspended until the steel labor situation is clarified.

BAR DELIVERIES LENGTHEN— Users of cold-finished bars have waited too long to order and now face disappointment, producers warn. In some cases, they've called mills in late February asking for March delivery. They're being informed that they can get nothing before late April or early May. Cold drawers have delivery problems of their own. They can't get hot-rolled carbon or alloy bars before mid-April. Most active of the cold-finished bar buyers are automotive part suppliers, fastener manufacturers, screw machine companies, and the electrical industry. Jobbers are least active.

INGOT RATE ADVANCES— Last week, steelmakers boosted their operations 2 points to 88 per cent of capacity. Production was about 2,492,000 net tons of steel for ingots and castings, the largest of any week since June 23, 1957.

The Steel Inventory Situation

Finished Steel . . .

Buildup of semifinished at steel plants portends: In March, monthly shipments of finished steel will top 7 million tons for first time since June, 1957.

Steel Inventory Buildup . . .

Users will add about 8 million tons to stocks this half, boosting their inventories to 21 million or possibly 22 million tons by July 1 when labor contract expires.

Illustrations by Bob Schuchman

Strike Odds Dip as Steel Stocks Rise

STRIKE-HEDGE buying is lowering the odds on a steel strike.

Most observers still think we'll have one, but they're not as positive as they were a couple of weeks ago.

STRIKE-HEDGE buying is also putting a false front on our ingot rate.

It hit 88 per cent of capacity last week, a hair below the all-time record weekly tonnage figure. Metalworking's business isn't that good.

• **Doubling Up** — Steel users are rushing to build inventories to nearly double what they were in the fourth quarter of 1958. That's what they figure they'll need to sweat out a four to six week, or longer, strike. So far there has been little, if any,

panic in their buying, and major producers told STEEL last week that the situation is well under control.

• **Timetable** — Inventories were down to about 12 million to 13 million tons following the severe cut-back of 1957-58; about 1 million tons were added during the fourth quarter. The buildup is expected to follow this pattern: During the first half, estimates of stock input range from 6 million to 13 million tons, with 8 million the most commonly mentioned figure. That would take users' stocks up to about 21 million tons by June 30 when the steel industry's labor contract expires.

Most producers hastily point out that their projected inventory figures are not absolutes. "Few of us

agree on exactly what constitutes inventory, and certainly nobody knows just how much tonnage is in it. But if you use those figures as an index, you at least get a sense of direction and magnitude," comments one steel official.

• **Three Kinds**—Not all the buildup is a hedge against a steel strike, officials emphasize. "Actually, there are three aspects to the buildup," states one commercial research manager. "First, users carried liquidation too far last year, and they are trying to bring stocks up to workable levels. Second, their rate of consumption is greater, and they require a higher level of inventory for normal operations. Third is the hedge against a steel strike."

At a Glance

Strike?

4 to 6 weeks would cut stocks to Jan. 1 level;
8 weeks would put them at rock bottom;
0 to 2 weeks would cut ingot rate 50%,
with slow recovery to 75% by yearend.

How much of today's ordering is prompted by the strike threat? Thirty-five per cent, says one eastern producer. Between 15 and 20 per cent, says an official of one of the medium size steel companies.

• **Not Too High**—One thing most officials agree upon: Inventories will not be excessively high on July 1. Says Marcus J. Aurelius, administrative vice president, U. S. Steel Corp.: "I expect an increase of about 6 million tons in steel inventories during the first half. This would bring stocks to . . . not far above the level prevailing after the steel strike in 1956." Even if stocks rose to 22 million tons, they would still be perhaps 3 million tons short of the level in mid-1956, when the industry was struck for five weeks.

To make any substantial headway on inventory, shipments of finished steel from the mills will have to average about 7 million tons a month. They haven't broken that

mark since June, 1957, but they should make it this month.

• **Strike Consequences** — If inventories reach 21 million tons, most industry officials feel that a four to six week strike in steel would have little, if any, economic consequences. Stocks would drop back to about the level prevailing at the beginning of the year, but few users would have to shut down except for imbalances in supplies.

As one market analyst points out: "Even during a strike, about 10 per cent of the industry would still be operating, and imports would probably be stepped up a bit. Then, too, many users might try to schedule their vacation periods at that time, so that consumption would drop to 5 million tons a month."

After such a strike, steelmakers agree that the industry's operating rate would bounce right back to about 75 per cent of capacity.

Occasional higher rates could be

expected during the fourth quarter.

• **Impact of Longer Strike**—If the strike should last six to eight weeks, as expected by purchasing agents queried by STEEL (see Feb. 16, pp. 93-95), most producers feel the impact on the economy would be substantial. Users would liquidate their stocks bought as a hedge against a strike, and they would be forced to dip into their ordinary working inventories, taking them down to rock bottom. Imbalances would show up quickly, forcing many of them to shut down. This would be the critical period in any wage negotiations, bringing economic and social pressures to bear on the companies for quick settlement.

Under such circumstances, steel-making operations would jump almost immediately after the settlement to 90 or 95 per cent of capacity, remaining strong until year-end. But producers feel that too much output would be lost to permit them to reach their minimum goal of 110 million tons for the year.

• **No Strike**—If there is no strike, or a short one, there will be a decided slump in the steel industry during July and August, with operations going as low as 45 to 50 per cent of capacity at first. (Some producers who hold that even a 20 million ton inventory will not be excessive maintain July and August would not be much different from other normal summer months.) There would then be a slow buildup to about 75 per cent of operations toward the end of the year.

• **Effect on Negotiations**—Some observers feel that the buildup will work in favor of management in contract negotiations, dropping the odds for a strike. (Negotiations are scheduled to get underway in New York on May 20 or 21.) They figure that the higher stocks go, the less will be the pressure from users for summer and early fall delivery.

Another observer feels that the labor situation may counterbalance any influence of high stocks. "What can they lose? Operations—and employment—would be down anyhow if there is no strike. The union may figure it might as well strike and have everybody out, but win more increases than they would in a strikeless settlement."

Sheets, Strip . . .

Sheet & Strip Prices, Pages 182 & 183

Tight and getting tighter: That's the way the sheetmakers describe the flat-rolled supply situation. Cold-rolled and galvanized sheets are being allocated, though producers shy away from the term, preferring to say that tonnage is being booked on the basis of traditional buying patterns.

Hot-rolled sheets are not in as tight supply as the other flat-rolled items, but they're getting tighter as demand increases.

It's thought the automakers have pretty well covered their requirements for the first half. Their ordering rate, in any case, is unchanged. But the leadtime for May orders hasn't arrived, and there is still the possibility that if sales of new cars don't perk up, steel tonnage for May delivery may be trimmed back.

Mills are experiencing few complaints of slow deliveries. There can be two explanations: 1. The mills have tried not to overbook, so they are not too far back in their ship-

ments. 2. Steel orders are for inventory, not current manufacturing.

Producers hold a lot of June orders, and their books will be full by the time leadtime arrives. They are even getting some orders for third quarter, and they are being allocated like those for the second quarter.

Not much significance is being attached to third quarter orders. It's figured that buyers are simply trying to protect themselves. In event of a strike and inventories drop, these orders might receive preferred treatment, it's thought. Should a strike be averted, the orders could be canceled.

Demand for narrow cold-rolled strip specialties is extending deliveries to New England consumers. Converters there are sold well into second quarter, and, in some cases, are hard pressed for hot-rolled specifications.

Seymour Mfg. Co., Seymour, Conn., made the first shipments of stainless last month. Buying by manufacturers is heavier than that by distributors, although distributors are taking up setaside tonnage reserved for them through the second quarter.

Except for 430 stainless, automotive demand for flat-rolled steel by New England parts suppliers is slower than it was last year.

Appliances To Consume More Galvanized Sheets

Appliances and galvanized ware are expected to consume 20 to 25 per cent more galvanized sheets this year than they did in 1958. The general strengthening of the economy is expected to be reflected in a stronger demand for appliances.

Last year shipments of galvanized sheets for use in appliances and galvanized ware increased 12.4 per cent over those in 1957, says the Committee on Galvanized Steel Sheet Research. Its data are based on figures compiled by the American Iron & Steel Institute.

The increase compares with a rise of about 18 per cent for the galvanized sheet industry over-all and an average decrease of 25 per cent for all steel products.

mercial and home refrigerators accounted for the greatest part of the appliance tonnage. Shipments amounted to 42,711 tons, up 18.5 per cent from 1957.

The tonnage for use in household appliances showed the sharpest rise—an increase of over 80 per cent. But shipments for use in washing machines and ironers dropped 7.5 per cent, while the tonnage for utensils and galvanized ware went up 10.8 per cent.

Tin Plate . . .

Tin Plate Prices, Page 183

Shipments of metal cans in 1958 totaled 4,760,725 tons, reports the Bureau of the Census. In 1957, the total was 4,594,968 tons.

December shipments were 288,651 tons, vs. 315,759 in November, and 291,521 in December, 1957.

Fruit and vegetable can shipments amounted to 1,509,759 tons last year, vs. 1,494,372 the year before.

In December, shipments of fruit and vegetable cans were 58,553 tons, vs. 74,475 in November, and 68,374 in December, 1957.

The movement of beer cans (second largest category) was 820,481 tons last year, compared with 791,507 in 1957.

December shipments are 61,093 tons, vs. 62,122 in November, and 56,515 in December, 1957.

Wire . . .

Wire Prices, Pages 183 & 184

While there is some hedge buying for April shipment, May and June are expected to bring out much heavier volume.

Consumption of wire and wire products is up moderately, notably high carbon precision springs and fastener makers' requirements. Automotive needs are also heavier. Industrial wire users are showing more concern for their second quarter supplies, and, in scattered instances, are placing protective orders through June.

Rod demand is heavier, and converters appear more disposed to cover their needs through the second quarter.

Reid Avery Co., Baltimore, has booked 130 tons of welding electrodes from the Navy.

Cable
Reels**

SCRUBBING THE SURFACES OF PLANES to reduce friction at supersonic speeds formerly was done by several men, working laboriously with hand cleaning equipment. But the installation of cleaning units like this one, equipped with WELDREEL dual hose reels, has cut to a minimum the time and manpower required...and results in better cleaning.

Using one hose for compressed air and the other for cleanser or detergent, cleaning may be completed in a short time by one man. The reel permits hose to be paid out to the length required...holds it there with a self locking pawl...and retracts it automatically with a heavy spring.

Designed to handle flammable fluids and gases safely in dual and single hose, leakproof WELDREEL reels are adaptable to a wide variety of industrial applications. Write for full information.

MODEL OA-A holds 50' of 3/16" or 40' of 1/4" dual hose. Model OAB has capacity for 150' of 1/4" or 125' of 5/16" hose.

MODEL EA-2 with current capacity of 300 amps holds 50' of 2/0 welding cable. Model EA has capacity of 100' cable.

MODEL A-1 has 50' capacity of 1/4" or 3/8" I.D. single hose. The larger Model A-2 holds 50' of 1/2" hose.

UNITED SPECIALTIES INC.
POST OFFICE BOX 688 EL DORADO, ARKANSAS

Steel Bars . . .

Bar Prices, Page 181

Business in the commercial steel bar market is improving. Modest gains in demand are reported for hot bars, while cold drawn and alloys are moving in noticeably better volume.

Hedge buying is increasing, though some business is for immediate manufacturing requirements. But most of the ordering appears to be for projected needs.

Cold drawers are ordering more

hot bar stock. Some of them say their drawing operations are held back by their inability to get all the hot stock they need for immediate use. One Pittsburgh area producer says customers are entering the market for substantial tonnage after delaying the placing of orders for weeks. Some seek March delivery tonnage. This maker is sold up through May. Even the warehouses are ordering cold finished in better volume.

The bulge in cold finished is largely in the smaller sizes, both

carbon and alloy grades. In general, April schedules are filling more rapidly than March's, with some users covering through May and June.

Deliveries on hot-rolled bars still range two to four weeks. Early rollings are not as easy to catch, and there is a noticeable tightening in schedules on the larger sized rounds. Cold-drawn carbon bars are still available in two to five weeks, cold drawn alloys in six to eight weeks.

Tubular Goods . . .

Tubular Goods Prices, Page 185

Pressure for oil country goods is mounting. One leading Pittsburgh area producer last week reported its order book was full through the second quarter. Demand, it says, has been noticeably heavy for certain sizes of casing and tubing, notably 9 $\frac{5}{8}$ and 13 $\frac{3}{8}$ in.

Requirements for merchant pipe continue to lag. But producers think there will be a sharp upturn in demand shortly. Prospects are considered promising for a strong seasonal spurt in construction requirements this spring.

Pipe mills say consumers are showing increasing interest in hedge buying. It's still uncertain whether this means the mills will shortly become loaded with tonnage as consumers rush to protect themselves against possible strike-induced shortages this summer.

There's no question, though, that the oil companies are actively replenishing their inventories—largely as protection against midsummer shortages since well drilling hasn't picked up appreciably. Buyers say they'll take first quarter delivery of all the tonnage they've ordered for first half.

Line pipe sales are somewhat improved.

Distributors . . .

Prices, Page 186

The steel service centers are doing better. Business is definitely improved, though demand isn't developing at the same rate it is at the mill level. Orders aren't up to distributors' expectations, though at Pittsburgh, more quick shipment orders are noted.

Generally, it's thought distributors' volume will rise sharply in

Protect your PUMPS and other Indispensable MACHINERY with THOMAS FLEXIBLE COUPLINGS

NO LUBRICATION

THOMAS FLEXIBLE COUPLING COMPANY
WARREN, PENNSYLVANIA, U.S.A.

the second quarter, especially should consumers find mill shipments backing up because of overloaded order books. Allocations and extended deliveries are directing some orders to warehouses.

Improved demand at the warehouse level is largely in the flat-rolled products, notably galvanized sheets. Some gains are also noted in alloy specialties, tool, and die steels.

A spokesman for major distributors in the Southwest has revised his forecast upward on first quarter volume. He expects business will be 15 to 20 per cent above the fourth quarter's. He previously forecast a 10 per cent rise.)

Plates . . .

Plate Prices, Page 181

Eastern plate mills can still accept orders for sheared material for April delivery. But some fabricating shops are ordering slightly beyond that month, placing strike hedge tonnage in rising volume. In fact, makers are almost unanimous in thinking that the pickup in ordering is due to hedge buying rather than increasing immediate consuming requirements.

Demand is rated "good." It is expected to keep moving upward through the middle of the second quarter.

In New England, a slight pickup in demand is noted, but absence of strong buying for capital goods equipment adversely affects weldment volume and tends to hold back forward buying. Tank shops have built up stocks of underground tanks for installation this spring, and they will be slow in rebuilding inventories of light gage plates until these finished units are moved.

Columbia - Geneva Steel Div., U. S. Steel Corp., is supplying 1140 tons of plates, including floor plates, for a passenger and automobile ferry being built by Puget Sound Bridge & Dredging Co., Seattle, for Black Ball Transport Inc.

The largest recent plate job in the Pacific Northwest went to the Gunderson Bros. Engineering Corp. It was placed by the Navy and involved 2000 tons, including light structurals.

Expectations are demand for tin plate will remain at a high level through the first half. Canning

companies are preparing for the 1959 pack, and the canmakers are replenishing their inventories as protection against a possible steel strike at midyear.

Granite City Steel Co., Granite City, Ill., reports its tin plate order bookings in February were 50 per cent above those placed in January.

Pig Iron . . .

Pig Iron Prices, Page 186

Blast furnace production of pig iron and ferroalloys in January was

6,260,395 net tons, 77.9 per cent of capacity, reports the American Iron & Steel Institute. Included were 48,572 tons of ferromanganese and spiegeleisen. The performance compares with 6,072,890 tons in December and 4,785,269 in January, 1958. It was the largest monthly output since October, 1957, when 6,454,450 tons were produced.

Merchant iron shipments show a little improvement, with foundry consumption rising, though still limited. Most shops are not operating above 60 per cent.

More idle blast furnaces are

have greater resistance to open hearth slag. Their use helps increase melting capacity, and reduces cost per ton.

We guide our business on the principles of service and dependability.

being relighted as the pressure for iron rises in step with expanding steelmaking operations. At Buffalo, Wickwire Spencer Div., Colorado Fuel & Iron Corp., plans to blow in a second stack now being repaired. When this happens, all ten of the steel mill blast furnaces in the district will be engaged. There are still two idle merchant stacks in the area.

Republic Steel Corp. resumed operation of its No. 2 blast furnace at East Thomas, Ala., last week. The stack has been idle since last July, and has been relined.

U. S. Steel Corp. has relighted its No. 1 blast furnace at the Duquesne Works near Pittsburgh. It had been idle since December, 1957, and its reactivation leaves only one of the Duquesne Works' six stacks idle.

Structural Shapes . . .

Structural Shape Prices, Page 181

The possibility of a steel strike this summer is speeding up the planning and placing of structural contracts. In some instances, where engineering is not too far advanced, jobs may be delayed until the steel labor outlook is clarified.

A strike may not immediately affect operations of some fabricating shops; some may not be affected at all. That's because labor contracts with many shops do not expire until after the showdown at the steel plants. A walkout at the mills could be called and ended before the time comes for a settlement at many fabricating plants.

But some of the largest fabricators' contracts expire about the same time as mill agreements end. This means they would probably close with the steel mills if a strike is called at midyear.

What many fabricators chiefly worry about is an adequate supply of plain material—shapes primarily, and, to an important degree, plates. By the time the strike deadline rolls around, many shops will probably have built up their inventories substantially.

Builders and architects are speeding up work where they can, bearing in mind the probable effects of labor demands on costs.

Shapes are in easier supply than other major products, including bars. There is some tightening,

STEEL

though, mostly in wide flange sections. Easy supply conditions could change quickly as the expanded capacity of the last couple of years fills up and the strike deadline nears. Already there has been a perceptible tightening in plate supply.

Fabricators are cognizant of this change, and are not only placing more orders for plates, but they are showing more interest in structurals. In the Chicago area, within the last several weeks, mill bookings for second quarter have gained noticeably, and some sellers can't fully accommodate demand for wide flange sections, though there's still some second quarter space in standard shape rolling schedules.

Bridge estimating is slightly heavier in New England. Contracts include 4800 tons for commercial buildings at Hartford, Conn. Wide flange beam volume is heavier in the district. A low bid on 1250 tons for a 13-span structure at Montpelier, Vt., was 12.10 cents a pound, including erection.

A large new job in the Pacific Northwest is the proposed trans-Columbia River interstate bridge at Astoria. Financial details have yet to be worked out.

Reinforcing Bars . . .

Reinforcing Bar Prices, Page 182

Imports are an irritating factor in the reinforcing steel market, particularly at coastal points. In the Pacific Northwest, imports of concrete bars and light shapes from Japan and Europe are reported to have totaled 8500 tons in 1958 and 4000 tons in January.

This competition is handicapping

domestic producers and is resulting in price fluctuation.

District fabricators report a fair volume of tonnage is out for public works, highways, and industrial construction projects. Highway bids at Salem, Oreg., to be opened Mar. 3, involve 900 tons of reinforcing bars.

Tool Steel . . .

Tool Steel Prices, Page 185

Shipments of high speed and tool steel (excluding hollow drill steel) totaled 70,270 net tons in 1958, reports the American Iron & Steel Institute. It compares with 98,712 tons in 1957, 125,866 in 1956, and 114,529 in 1955.

December shipments were 6835 tons, compared with 6601 in the preceding month, and 6710 in December, 1957.

Prices on solid cemented carbide drills, reamers, and end mills have been increased by Super Tool Co., division of Van Norman Industries, Detroit. The increase ranges up to 10 per cent on items 1/4 in. in diameter and larger. It is in line with recent advances by major carbide metal producers. It does not apply to cutting tools tipped with the carbide metal.

Stainless Steel . . .

Stainless Steel Prices, Page 185

Four contracts, involving 245 tons of stainless steel sheets, have been placed by the General Stores Supply Office, Navy, Philadelphia. Of the total, 186 tons will be supplied by Eastern Stainless Steel Corp., Baltimore, at a cost of \$241,144, while 59 tons will be supplied by the Ingersoll Steel Div., Borg-Warner Corp., Chicago, at a cost of \$78,286.

Chemical Prices Reduced

Immediate price reductions on three amine-borane compounds are announced by Callery Chemical Co., Pittsburgh. New prices (per pound in 100 lb lots) are: Pyridine-borane \$14; dimethylamine-borane \$20; trimethylamine-borane \$22.

Purchased in lots of less than 100 lb, prices range to \$1.50 a pound more on each compound. All prices are f.o.b. Callery, Pa.

Amine-boranes are selective re-

Remove Welding Fumes at the Source... with RUEMELIN FUME COLLECTOR

ducing agents in nonaqueous solvents, polymerization catalysts, antioxidants, and stabilizing agents.

Japan Taking Coast Scrap

Shipments of scrap to Japan are running about two boatloads a month, and San Francisco suppliers anticipate an increase in the export volume.

Demand from Pacific Coast mills is not great, but talk continues of a possible price increase when March postings appear.

The buyer for one of the large mills, however, says there will probably be no change. He feels that the recent breaking off of price negotiations in Japan (Feb. 20), will take pressure off prices for another month at least.

Semifinished Steel . . .

Semifinished Prices, Page 181

Steelmaking operations advanced 2 points last week to 88 per cent of capacity. That's equal to output of 2,491,571 net tons for the week and is the highest rate of production since the week ended June 23, 1957. The record: 2,525,000 net tons in the week ended Dec. 17, 1956.

Sharon Steel Corp. is starting up its Lowellville, Ohio, steelworks which has been on standby since last April. Three open hearth furnaces, plus the blooming mill and bar mill facilities, are being reactivated.

Wickwire Spencer Steel Div., Colorado Fuel & Iron Corp., is scheduling the relighting of a second

open hearth furnace. This Buffalo district mill is experiencing a pickup in demand for wire products from roadbuilders and the wire fence industry.

Tonnagewise, 90.5 per cent ingot operations in the Chicago district are the best in that area since the week ended Jan. 6, 1957.

St. Louis area producers expect capacity operations until July in sheets, plates, tin plate, and galvanized sheets. Orders or commitments on books assure capacity output in those categories the first half. Third quarter books are not opened, but they are expected to be by mid-April.

Steel Shipments by Markets—December, 1958

(Net tons; all grades)

	December, 1958	12 Month Totals 1958	1957
Markets:			
Converting & Processing	254,469	2,854,574	3,396,529
Forgings (other than auto)	88,818	767,217	1,056,036

Got a problem that calls for thread-cutting screws?

PARKER-KALON offers three new, improved thread-cutting screws for every application in every material

1 New, Improved P-K Type F*

... hardened thread-cutting screws developed for use in friable, granular or brittle material. The pilot, with its five tapping flutes, cuts a machine screw thread as the screw is turned in. The Type F is ideal for making fastenings to ferrous and non-ferrous castings, bronze or brass forgings, heavy gage sheet metals, structural steels, plastics and resin-impregnated plywood.

2 "Pentap"... the new, Improved P-K Type B-F*

(formerly F-Z) combining the five thread-cutting flutes of the Type F screw with the coarse-pitch, widely-spaced threads of the P-K Type B. The thread-cutting "Pentap" Type B-F distributes cutting pressure evenly, lets chips drop to the bottom of the hole, and prevents cracking of material. It is designed for making fastenings to comparatively thin sections and bosses in friable and brittle plastics.

3 P-K® Type L†

... is a completely new and improved thread-cutting screw developed by Parker-Kalon especially for use in Nylon. The Type L functions as a combination thread-cutting and thread-forming screw in that it cuts a small amount of the Nylon to allow the full diameter threads to form. Type L offers a particular advantage in Nylon assemblies which must be disassembled for service, because the P-K Type L can be removed and replaced without stripping or galling.

The five cutting flutes on the new, improved P-K Type "F" and "BF" reduce pressure development by 80 percent! The completely formed threads on these screws have sharper cutting edges, and 5 deep flutes that are of continuous depth. These features make for better clearance of the accumulated material and assure minimum stresses in driving, and avoid the possibility of stripping or galling.

FOR SEMS ... and Neoprene or Nylon washer STAPS® in thread-cutting and thread-forming lapping screws, or machine screws in any kind of pre-assembled fastener-washer combination, P-K can supply them, too!

FOR SAMPLES OF P-K THREAD-CUTTING SCREWS AND SEMS, CALL YOUR LOCAL P-K "BULK-STOCKING" DISTRIBUTOR

FASTENERS

(Base discounts, shipments
of one to four containers, per
cent off list, f.o.b. mill)

BOLTS

Machine Bolts	
Full Size Body (cut thread)	
1/2 in. and smaller:	
3 in. and shorter	55.0
3 1/2 in. thru 6 in.	50.0
Longer than 6 in.	37.0
1/2 in., 3 in. & shorter	47.0
3 1/2 in. thru 6 in.	40.0
Longer than 6 in.	31.0
1/2 in. thru 1 in.:	
6 in. and shorter	37.0
Longer than 6 in.	31.0
1 1/2 in. and larger:	
All lengths	31.0
Undersize Body (rolled thread)	
1/2 in. and smaller:	
3 in. and shorter	55.0
3 1/2 in. thru 6 in.	50.0

Carriage Bolts

Full Size Body (cut thread)	
Undersize Body (rolled thread)	
1/2 in. and smaller:	
6 in. and shorter	48.0
Larger diameters and longer lengths	35.0

Lag, Plow, Tap, Blank

Step, Elevator, Tire, and Fitting Up Bolts	
1/2 in. and smaller:	
6 in. and shorter	48.0
Larger diameters and longer lengths	35.0

High Tensile Structural Bolts

(Reg. semifinished hex head bolts, heavy semifinished hex nuts. Bolts — High-carbon steel, heat treated, Spec. ASTM A-325, in bulk. Full leg quantity)	
1/2 in. diam.	50.0
3/4 in. diam.	47.0
1 in. and 1 1/4 in. diam.	43.0
1 1/2 in. and 1 3/4 in. diam.	34.0

NUTS

(Keg or case quantity and over)	
Square Nuts, Reg. & Heavy:	
All sizes	56.0

(Full container)

Hex Nuts, Reg. & Heavy

Hot Pressed & Cold Punched:	
3/4 in. and smaller:	62.0
1/2 in. to 1 1/2 in., incl.	56.0
1 1/2 in. and larger:	51.5

Hex Nuts, Semifinished,

Heavy (Incl. Slotted):	
3/4 in. and smaller:	62.0
1/2 in. to 1 1/2 in., incl.	56.0
1 1/2 in. and larger:	51.5

Hex Nuts, Finished (Incl.

Slotted and Castellated):	
3/4 in. and smaller:	65.0
1 in. to 1 1/2 in., incl.	57.0
1 1/2 in. and larger:	51.5

Semifinished Hex Nuts, Reg.

(Base discounts, packages, per cent off list, f.o.b. mill)	
3/4 in. and smaller:	62.0
1/2 in. to 1 1/2 in., incl.	65.0
1 in. to 1 1/2 in., incl.	57.0
1 1/2 in. and larger:	51.5

Ferroalloys

MANGANESE ALLOYS

Spiegeleisen: Carlot, per gross ton, Palmerton, Neville Island, Pa. 21-23% Mn, \$105; 19-21% Mn, 1-3% Si, \$102.50; 16-19% Mn, \$100.50.

Standard Ferromanganese: (Mn 74-76%, C 7% approx) base price per net ton, \$245, Johnstown, Duquesne, Sheridan, Neville Island, Pa.; Alloy, W. Va.; Ashtabula, Marietta, O.; Sheffield, Ala.; Portland, Oreg. Add or subtract \$2 for each 1% or fraction thereof of contained manganese over 76% or under 74%, respectively. (Mn 79-81%). Lump \$253 per net ton, f.o.b. Anaconda or Great Falls, Mont. Add \$2.60 for each 1% above 81%; subtract \$2.60 for each 1% below 79%, fractions in proportion to nearest 0.1%.

High-Grade Low-Carbon Ferromanganese: (Mn 85-95%). Carload, lump, bulk, max 0.07% C, 35.1c per lb of contained Mn, carload packed 36.4c, ton lots 37.9c, less ton 39.1c. Delivered. Deduct 1.5c for max 0.15% C grade from above prices, 3c for max 0.03% C, 3.5c for max 0.5% C, and 6.5c for max 75% C—max 7% Si. **Special Grade:** (Mn 90% min, C 0.07% max, P 0.006% max). Add 2.05c to the above prices. Spot, add 0.25c.

Medium-Carbon Ferromanganese: (Mn 80-85%, C 1.25-1.5%, Si 1.5% max). Carload, lump, bulk, 25.5c per lb of contained Mn; packed, carload 26.8c, ton lot 28.4c, less ton 29.6c.

Manganese Metal: 2" x D (Mn 95.5% min, Fe 2% max, Si 1% max, C 0.2%). Carload, lump, bulk, 45c per lb of metal; packed, carload 45.75c, ton lot 47.25c, less ton lot. Delivered. Spot, add 2c.

Electrolytic Manganese Metal: Min carload, bulk, 33.25c; 2000 lb to min carload, 36c; less ton, 38c; 50 lb cans, add 0.5c per lb. Premium for hydrogen-removed metal, 0.75c per lb. Prices are f.o.b. cars, Knoxville, Tenn., freight allowed to St. Louis or any point east of Mississippi River; or f.o.b. Marietta, O., freight allowed.

Silicomanganese: (Mn 65-68%). Carload, lump, bulk, 1.50% C grade, 18-20% Si, 12.8c per lb of alloy. Packed, c.l. 14c, ton 14.45c, less ton 15.45c, f.o.b. Alloy, W. Va.; Ashtabula, Marietta, O.; Sheffield, Ala.; Portland, Oreg. For 2% C grade, Si 15-17%, deduct 0.2c from above prices. For 3% grade, Si 12-14.5%, deduct 0.4c from above prices. Spot, add 0.25c.

TITANIUM ALLOYS

Ferrotitanium, Low-Carbon: (Ti 20-25%, Al 5% max, Si 4% max, C 0.10% max). Contract, ton lot, 2" x D, \$1.50 per lb of contained Ti; less ton to 300 lb, \$1.55. (Ti 38-43%, Al 8% max, Si 4% max, C 0.10% max). Ton lot \$1.35, less ton to 300 lb \$1.37, f.o.b. Niagara Falls, N. Y., freight allowed to St. Louis.

Ferrotitanium, High-Carbon: (Ti 15-18%, C 6-8%). Contract min c.l. \$240 per ton, f.o.b. Niagara Falls, N. Y., freight allowed to destinations east of Mississippi River and north of Baltimore and St. Louis. Spot, \$245.

Ferrotitanium, Medium-Carbon: (Ti 17-21%, C 2-4%). Contract, c.l. \$290 per ton, f.o.b. Niagara Falls, N. Y., freight not exceeding St. Louis rate allowed. Spot, \$295.

CHROMIUM ALLOYS

High-Carbon Ferrochrome: Contract, c.l. lump, bulk 28.75c per lb of contained Cr; c.l. packed 30.30c, ton lot 32.05c, less ton 33.45c. Delivered. Spot, add 0.25c.

Low-Carbon Ferrochrome: Cr 63-66% (Simplex), carload, lump, bulk, C 0.025% max, 38.75c per lb contained Cr; 0.010% max, 37.75c. Ton lot, add 3.5c; less ton, add 5.2c. Delivered.

Cr 67-71%, carload, lump, bulk, C 0.02% max, 41.00c per lb contained Cr; 0.025% max, 39.75c; 0.05% max, 39.00c; 0.10% max, 38.50c; 0.20% max, 38.25c; 0.50% max, 38.00c; 1.0% max, 37.75c; 1.5% max, 37.50c; 2.0% max, 37.25c. Ton lot, add 3.4c; less ton lot, add 5.1c. Delivered.

Foundry Ferrochrome, High-Carbon: (Cr 61-66%, C 5-7%, Si 7-10%). Contract, c.l., 2 in. x D, bulk 30.8c per lb of contained Cr. Packed, c.l. 32.4c, ton 34.2c, less ton 35.7c. Delivered. Spot, add 0.25c.

Foundry Ferrosilicon Chrome: (Cr 50-54%, Si 28-32%, C 1.25% max). Contract, carload packed, 8M x D, 21.25c per lb of alloy, ton lot 22.50c; less ton lot 23.70c. Delivered. Spot, add 0.25c.

Ferrochrome-Silicon: Cr 39-41%, Si 42-45%, C 0.05% max or Cr 33-36%, Si 45-48%, C 0.05% max. Carload, lump, bulk, 3" x down and 2" x down, 28.25c per lb contained Cr, 14.60c per lb contained Si, 0.75" x down 29.40c per lb contained Cr, 14.60c per lb contained Si.

Chromium Metal, Electrolytic: Commercial grade (Cr 99.8% min, metallic basis, Fe 0.2% max). Contract, carlot, packed, 2" x D plate (about 1/4" thick) \$1.15 per lb, ton lot \$1.17, less ton lot \$1.19. Delivered. Spot, add 5c.

VANADIUM ALLOYS

Ferrovanadium: Open-hearth grade (V 50-55%, Si 8% max, C 3% max). Contract, any quantity, \$3.20 per lb of contained V. Delivered. Spot, add 10c. **Special Grade:** (V 50-55% or 70-75%, Si 2% max, C 0.5% max) \$3.30. **High Speed Grade:** (V 50-55% or 70-75%, Si 1.50% max, C 0.20% max) \$3.40.

Grainal: Vanadium Grainal No. 1 \$1.05 per lb; No. 79, 50c, freight allowed.

Vanadium Oxide: Contract, less carload lot, packed, \$1.38 per lb contained V₂O₅, freight allowed. Spot, add 5c.

SILICON ALLOYS

50% Ferrosilicon: Contract, carload, lump, bulk, 14.6c per lb contained Si. Packed, c.l. 17.1c, ton lot 18.55c, less ton 20.20c, f.o.b. Alloy, W. Va.; Ashtabula, Marietta, O.; Sheffield, Ala.; Portland, Oreg. Spot, add 0.45c.

Low-Aluminum 50% Ferrosilicon: (Al 0.40% max). Add 1.45c to 50% ferrosilicon prices.

65% Ferrosilicon: Contract, carload, lump, bulk, 15.75c per lb contained silicon. Packed, c.l. 17.75c, ton lot 19.55c, less ton 20.9c. Delivered. Spot, add 0.35c.

75% Ferrosilicon: Contract, carload, lump, bulk, 16.9c per lb of contained Si. Packed, c.l. 18.8c, ton lot 20.45c, less ton 21.7c. Delivered. Spot, add 0.3c.

90% Ferrosilicon: Contract, carload, lump, bulk, 20c per lb of contained Si. Packed, c.l. 21.65c, ton lot 23.05c, less ton 24.1c. Delivered. Spot, add 0.25c.

Silicon Metal: (98% min Si, 1.00% max Fe, 0.07% max Ca). C.l. lump, bulk, 21.5c per lb of Si. Packed, c.l. 23.15c, ton lot 24.45c, less ton 24.45c. Add 0.5c for max 0.03% Ca grade. Add 0.5c for 0.50% Fe grade analyzing min 98.25% min Si.

Alsifer: (Approx 20% Al, 40% Si, 40% Fe). Contract, basis f.o.b. Niagara Falls, N. Y., lump, carload, bulk, 9.85c per lb of alloy; ton lot, packed, 10.85c.

ZIRCONIUM ALLOYS

12-15% Zirconium Alloy: (Zr 12-15%, Si 39-43%, C 0.20% max). Contract, c.l. lump, bulk, 9.25c per lb of alloy. Packed, c.l. 10.45c, ton lot 11.6c, less ton 12.45c. Delivered. Spot, add 0.25c.

35-40% Zirconium Alloy: (Zr 35-40%, Si 47-52%, Fe 8-12%, C 0.50% max). Contract, carload, lump, packed 27.25c per lb of alloy, ton lot 28.4c, less ton 29.65c. Freight allowed. Spot, add 0.25c.

BORON ALLOYS

Ferrobore: 100 lb or more packed (B 17.50% min, Si 1.50% max, Al 0.50% max, C 0.50% max). Contract, 100 lb or more 1" x D, \$1.20 per lb of alloy; less than 100 lb \$1.30. Delivered. Spot, add 5c. F.o.b. Washington, Pa., prices, 100 lb and over are as follows: Grade A (10-14% B) 85c per lb; Grade B (14-18% B) \$1.20; Grade C (19% min B) \$1.50.

Borosil: (3 to 4% B, 40 to 45% Si). Carload, bulk, lump, or 3" x D, \$5.25 per lb of contained B. Packed, carload \$5.40, ton to c.l. \$5.50, less ton \$5.60. Delivered.

Carbortam: (B 1 to 2%). Contract, lump, carload \$320 per ton, f.o.b. Suspension Bridge, N. Y., freight allowed same as high-carbon ferrotitanium.

CALCIUM ALLOYS

Calcium-Manganese-Silicon: (Ca 16-20%, Mn 14-18% and Si 53-59%). Contract, carload, lump, bulk 23c per lb of alloy, carload packed 24.25c, ton lot 26.15c, less ton 27.15c. Delivered. Spot, add 0.25c.

Calcium-Silicon: (Ca 30-33%, Si 60-65%, Fe 1.5-3%). Contract, carload, lump, bulk 24c per lb of alloy, carload packed 25.65c, ton lot 27.95c, less ton 29.45c. Delivered. Spot, add 0.25c.

BRIQUETTED ALLOYS

Chromium Briquets: (Weighing approx 3 1/2 lb each and containing 2 lb of Cr). Contract, carload, bulk 19.60c per lb of briquet, in bags 20.70c; 3000 lb to c.l. pallets 20.80c; 2000 lb to c.l. in bags 21.90c; less than 2000 lb in bags 22.80c. Delivered. Add 0.25c for notching. Spot, add 0.25c.

Ferromanganese Briquets: (Weighing approx 3 lb and containing 2 lb of Mn). Contract, carload, bulk 14.8c per lb of briquet; c.l., packed, bags 16c; 3000 lb to c.l., pallets 16c; 2000 lb to c.l., bags 17.2c; less ton 18.1c. Delivered. Add 0.25c for notching. Spot, add 0.25c.

Silicomanganese Briquets: (Weighing approx 3 1/2 lb and containing 2 lb of Mn and approx 1/2 lb of Si). Contract, c.l. bulk 15.1c per lb of briquet; c.l. packed, bags 16.3c, 3000 lb to c.l., pallets 16.3c; 2000 lb to c.l., bags 17.5c; less ton 18.4c. Delivered. Add 0.25c for notching. Spot, add 0.25c.

Silicon Briquets: (Large size—weighing approx 5 lb and containing 2 lb of Si and small sizes, weighing approx 2 1/2 lb and containing 1 lb of Si). Contract, carload, bulk 8c per lb of briquet; packed, bags 9.2c; 3000 lb to c.l., pallets 9.6c; 2000 lb to c.l., bags 10.8c; less ton 11.7c. Delivered. Spot, add 0.25c.

Molybdc-Oxide Briquets: (Containing 2 1/2 lb of Mo each). \$1.49 per lb of Mo contained, f.o.b. Langeloth, Pa.

Titanium Briquets: Ti 98.27%, \$1 per lb, f.o.b. Niagara Falls, N. Y.

TUNGSTEN ALLOYS

Ferrotungsten: (70-80%). 5000 lb W or more \$2.15 per lb (nominal) of contained W. Delivered.

OTHER FERROALLOYS

Ferrocolumbium: (Cb 50-60%, Si 8% max, C 0.4% max). Ton lots 2" x D, \$4 per lb of contained Cb; less ton lots \$4.05 (nominal). Delivered.

Ferrotantalum Columbium: (Cb 40% approx, Ta 20% approx, and Cb plus Ta 60% min, C 0.30% max). Ton lots 2" x D, \$3.80 per lb of contained Cb plus Ta, delivered; less ton lots \$3.85 (nominal).

SMZ Alloy: (Si 60-65%, Mn 5-7%, Zr 5-7%, Fe 20% approx). Contract, c.l. packed 1/2-in. x 12 M 20.00c per lb of alloy, ton lot 21.15c, less ton 22.40c. Delivered. Spot, add 0.25c.

Graphidox No. 4: (Si 48-52%, Ca 5-7%, Ti 9-11%). C.l. packed, 20c per lb of alloy, ton lot 21.15c; less ton lot 22.4c, f.o.b. Niagara Falls, N. Y.; freight allowed to St. Louis.

V-5 Foundry Alloy: (Cr 38-42%, Si 17-19%, Mn 8-11%). C.l. packed 18.45c per lb of alloy; ton lot 19.95c; less ton lot 21.20c, f.o.b. Niagara Falls, N. Y.; freight allowed to St. Louis.

Simanal: (Approx 20% each Si, Mn, Al; bal Fe). Lump, carload, bulk 19.25c. Packed c.l. 20.25c, 2000 lb to c.l. 21.25c; less than 2000 lb 21.75c per lb of alloy. Delivered.

Ferrophosphorus: (23-25% based on 24% P content with unitage of \$5 for each 1% of P above or below the base). Carload, bulk, f.o.b. sellers' works. Mt. Pleasant, Siglo, Tenn., \$120 per gross ton.

Ferromolybdenum: (55-75%). Per lb of contained Mo, in 200-lb container, f.o.b. Langeloth and Washington, Pa. \$1.76 in all sizes except powdered which is \$1.82.

Technical Molybdc-Oxide: Per lb of contained Mo, in cans, \$1.47; in bags, \$1.46, f.o.b. Langeloth and Washington, Pa.

ALWAYS FULL COUNT, FULL QUALITY IN ALCOA ALUMINUM FASTENERS!

YOU'LL FIND 144 or more *perfect* fasteners in *every* gross box when you order from your local Alcoa Distributor. On bulk items, too, you'll receive the number of pieces ordered. And there'll be no rejects, no misfits, no "seconds" . . . whether you buy a hatful or a carload!

And, of course, Alcoa® Aluminum Fasteners give you maximum protection against corrosion. Their bright, flawless finish adds extra sales appeal to your product

at the time of purchase—and won't stain or mar it at any time *after* purchase.

Your Alcoa Distributor carries *complete* stocks of all standard types and sizes, locally—for really prompt filling of your orders. You'll find him in the Yellow Pages of your phone book. Why not give him a call right now? Or, if you'd like additional facts and a few samples, just mail the coupon!

Steel Rate Rise Bolsters Scrap

STEEL's composite on No. 1 heavy melting steel advances 33 cents to \$42.83 despite continued absence of active demand. Exports are helping the market sentiment

Scrap Prices, Page 192

Pittsburgh—District steelmaking operations are at the highest level (87 per cent of capacity) since July, 1957, but the mills are showing little interest in scrap. Brokers expect one of the big consumers to place an order soon. Prices are firm.

New York—The local market has a strong undertone. Demand is expanding, on both domestic and export account. The movement abroad is principally to Japan and Spain.

Brokers have advanced their buying prices on most carbon steel grades about \$1 a ton. They are quoting \$31-\$32 for No. 1 heavy melting and No. 1 bundles and \$28-\$29 for No. 2 heavy melting. No. 2 bundles are unchanged at \$19-\$20.

Machine shop turnings are higher at \$12-\$13, mixed borings and turnings at \$15-\$16, short shoveling turnings at \$16-\$17, and low phos structurals and plate at \$35-\$36.

The cast iron grades are steady, but stainless scrap specialties are stronger with 18-8 sheets quoted \$195-\$200 and type 430 sheets, \$90-\$95. There's no change in 18-8 borings and turnings and type 410 material.

Chicago—Steel production in this district is at its highest level since the start of 1957, but it is having little effect on the scrap market. At the moment, the market appears slightly weaker. Mills are buying sparingly. They hold substantial inventories and are relying heavily on hot metal. Four district blast furnaces are still idle, and they are likely to be blown in before scrap

volume increases. Cast iron scrap continues in strong demand as gray iron foundry activity picks up moderately.

Philadelphia—Prices are firm. Business is good, and dealers are optimistic. One reason: Scrap delivered at Port Richmond for export is bringing better prices than that delivered at domestic mills. If there is any slackening, exports will help fill the gap.

Cleveland—Month-end automotive lists will set the market pace for March. Dealers are holding to their quoted prices despite the absence of active demand for open market scrap. Strong steelmaking rates (86.5 per cent in Cleveland and 88 per cent in the Valley) serve to encourage the hope of early active buying by the mills. Heavy use of blast furnace hot metal is holding down the scrap to pig iron ratio in open hearth furnace charges.

Detroit—The feeling is that the movement in prices (up or down) will be less than \$2 after auto lists close this week. Brokers and dealers report a quiet market; with buying absent, prices are on the soft side.

are engineered to YOUR specific requirements

"C" steel castings are CLEAN steel castings of uniform structure that will minimize machining and assembly costs, permit of greater freedom and efficiency of design and add to your product the recognized strength, endurance and desirability of steel. C steel castings, foundry engineered from pattern to finished casting can be had in

STEELMAKING SCRAP PRICE COMPOSITE

Based on No. 1 heavy melting grade at Pittsburgh, Chicago, and eastern Pennsylvania—Compiled by STEEL.

McLouth Steel is expected to do little buying this month because it has built up a backlog since strikes closed the works down for a week in February. Other mills in the area know there will be plenty of scrap available and won't be compelled to rush into the market. They are placing orders as the market trend turns to their advantage.

St. Louis—Prices are unchanged, but the market appears to be weakening. Dealers say supplies are more than adequate for demand, with the mills using more hot metal.

Buffalo—Higher prices have brought out a heavy flow of scrap, and local mills are now well supplied. Most observers think the market has reached a plateau, and dealers are not speculating by holding back tonnage.

In view of the strong movement of scrap last month, there is a growing feeling that the mills will be able to buy March tonnage at prevailing prices. Few anticipate a further price increase now.

Local mills are operating above capacity levels. They are using substantial scrap tonnage, giving dealers their best run of business in more than a year.

Youngstown—Dealers are marking time pending developments in the current steel buying rush. The mills are loaded with orders for steel, but they are inclined to maintain open hearth charges on a high percentage of hot metal. Scrap prices are still considered beyond the point where it would be more

economical to increase the scrap charge in the steel melt.

No important orders have developed here since one mill recently paid \$48 for No. 1 dealer scrap, and another paid \$50 for industrial material.

Houston—Brokers' buying prices are unchanged here in a slow market. The leading mill holds a large inventory. It indicates it will move slowly in formulating its March scrap buying program. The other Texas mill raised prices in mid-February and is receiving speeded shipments. Export buying is holding with \$37 quoted top on No. 1 heavy melting steel. Texas border scrap is moving south on relatively strong Mexican prices.

Birmingham—While the scrap movement continues slow, Atlantic Steel Co., Atlanta, has resumed operations after a three-month strike shutdown. It is offering \$2 a ton more for heavy melting steel than it paid just before the strike.

Most Alabama consumers appear to be adequately supplied. The ingot rate is holding around 79 per cent of capacity.

The export market is more active. Prices at Mobile, Ala., and New Orleans are reported higher at \$39 f.a.s. for No. 1, and \$35 for No. 2 steel.

Los Angeles—Japanese demand is expected to prop prices in this area. Increased domestic mill interest, and slow collections due to adverse weather conditions, also are serving to firm up the market. Heavier mill

buying is thought to be in prospect despite their substantial inventories.

Portland, Oreg.—Yard operators are optimistic, although demand continues slow, and prices are nominal. The market outlook is considered promising, especially on export account.

Yard stocks are down. It's said that to attract shipments from the interior, some coast buyers are offering premium prices and are absorbing some freight.

Cincinnati—Local mills are expected to enter the market shortly, and prices could quickly take an upward turn, or slip backward, as much as \$1 a ton. Brokers say the mills haven't indicated any eagerness to acquire tonnage despite strong steel operating rates.

STRUCTURAL SHAPES . . .

STRUCTURAL STEEL PLACED

- 4400 tons, office building, Urfs Bros. (owners and builders), 350 Park Ave., New York, to Harris Structural Steel Co., New York.
- 3200 tons, addition, Fox Department Store, Hartford, Conn., to Lehigh Structural Steel Co., Allentown, Pa.; Turner Construction Co., New York, general contractor.
- 1600 tons, office building, First National Bank, Hartford, Conn., to Topper & Griggs (Bethlehem Fabricators Inc.), Hartford, Conn.
- 1370 tons, municipal bus garage, Queens, N. Y., through Melnick & Co., to Bethlehem Fabricators, Bethlehem, Pa.
- 1250 tons, 13-span composite, wide flange beam bridge, Winooski River, Montpelier, Vt., to the American Bridge Div., U. S. Steel Corp., Pittsburgh; E. D. Swett Inc., Pembroke, N. H., general contractor.
- 300 tons, trashracks, hoists and other facilities, Rocky Reach Dam, Washington State, to Monarch Forge & Machine Works, Portland, Oreg., low at \$184.606, to Chelan County P.U.D., Wenatchee, Wash.
- 650 tons, Public School No. 5, Bronx, N. Y., to Bethlehem Fabricators, Bethlehem, Pa.
- 555 tons, state highwaywork, Brooklyn, N. Y., to Pine Brook Iron Works, Scranton, Pa.
- 500 tons, galvanized transmission towers for Pacific Power & Light Co., Portland, Oreg., to Bethlehem Pacific Coast Steel Corp., Seattle.
- 430 tons, two state bridges, Rehoboth, Mass., to Tower Iron Works, Providence, R. I.; Campanella & Cardi Construction Co. Inc., general contractor.
- 345 tons, four-span rolled beam bridge, East Hartford, Conn., to Standard Structural Steel Co., Hartford, Conn.; White Oak Excavators Inc., Plainville, Conn., general contractor.
- 250 tons, readiness crew building, Dow AFB, Bangor, Maine, to Hussey Mfg. Co., North Berwick, Maine, and magazine, Progressive Iron Works, Bangor; Consolidated Constructors Inc., Portland, Maine, general contractor.
- 235 tons, service club and shop buildings, Westover AFB, Chicopee Falls, Mass., to Haarmann Structural Steel Co., Holyoke, Mass.; Davison Construction Co. Inc., Manchester, N. H., general contractor; also, 50 tons of concrete reinforcing bars to Bethlehem Steel Co., Boston.
- 215 tons, 3-span, wide flange beam bridge, Berlin-Montpelier, Vt., to Vermont Structural Steel Co., Burlington, Vt.; S. V. Rossi Construction Co., Torrington, Conn., general contractor.
- 200 tons, plywood plant, Albany, Oreg., to

LOGEMANN *presents* the new giant triple-compression 4000-P Series of **SCRAP PRESSES**

The bales shown, left to right, comprise 1660 lbs. of bulky miscellaneous scrap, two pre-burned, stripped automobile bodies weighing 1900 lbs., two smaller pre-burned, stripped bodies weighing 1740 lbs., one large unburned body with frame, axles, etc., weighing 2280 lbs., and another unburned lighter body with frame, axles, etc., weighing 2020 lbs.

- **Bale Densities are Extremely High!**
- **Giant Press Box is 20 ft. x 7 ft. x 5 ft.**
- **Two 150 HP Pumps Generate Hydraulic Pressure**

In this Logemann Scrap Press compressed bales measure 24 inches by 24 inches by a variable third dimension which is determined by the character and quantity of scrap charged. The first or gathering ram compresses the load of scrap from 20 ft. to 2 ft. . . . the intermediate side ram reduces the cross-dimension from 7 ft to 2 ft. . . . finally the third or finishing ram moves upward, to compress the vertical dimension into an extremely dense bale, ready for remelting. The cover is then withdrawn and the finishing ram elevates the compressed bale level with the top of the box, to allow the cover to push it off for loading into cars.

Two large 150 HP pumps generate hydraulic pressure for operating the press-rams at high pressures. Three smaller pumps are used to operate the press cover and the loading hopper. This hopper can be filled with miscellaneous scrap while the press is making a bale, and

then dumped quickly into the box as soon as the preceding bale has been discharged.

The large pumps give rapid movement to all rams, and to handle their fluid delivery the operating-valves are proportionately over-size. These valves are operated by compressed air and easily controlled from a remote stand, through a bank of electrical switches and push-buttons, in front of the operator.

This same press can be used for baling bodies and extremely bulky scrap, also for making standard size, high-density bales of new sheet clips.

We are prepared to build many smaller sizes or larger, if required, to meet your specific requirements. You are invited to present your problem for discussion.

Write for details about the newly developed 3500-P series with tamping cover and side bale ejection and the new giant double compression press with box 20 ft. long, 7½ ft. wide, and 5 ft. deep.

LOGEMANN BROTHERS CO.

First Quarter Sales Spotty

Demand is generally much better than it was a year ago, but most producers still have their problems. Sales slump pulls lead, zinc prices down to 11 cents a pound

Nonferrous Metal Prices, Pages 196 & 197

AS 1959's first quarter enters the home stretch, it shapes up like this: Demand for major nonferrous metals isn't running as hard as some prognosticators believed it would. Neither has the recovery fizzled out as others predicted.

Sales are spotty. Business continues at a gallop for some metals. Others can't seem to get started. Conditions aren't likely to change appreciably this month.

• **Copper**—While producers aren't being overwhelmed with orders, demand is strong and continuous enough to keep the red metal in tight supply. The two major copper consumers, brass and wire mills, are running at a good clip, and evidence seems to be mounting that some customers are laying in inventories as a hedge against a possible summer strike at domestic mines and refineries.

Custom smelters boosted their quotation another half cent to 31 cents a pound on Feb. 24. The move was spurred by rising world prices and a shortage of salable metal brought on by the tightness in the scrap market. Custom copper could go higher in the near future.

• **Aluminum**—Demand is fair but probably disappointing to some industry sales forecasters. But the situation hasn't dimmed the industry's long range sales analysis. For instance, Walter L. Rice, vice president of Reynolds Metals Co., says consumption projections by his company indicate U. S. usage will climb to 10 million tons by 1975 (about five times present use).

Things aren't so rosy now. January marked the second month in a row that primary output hit an all-time high (see chart). Business isn't good enough to support this high production level—especially

when you consider that "put rights" to the government, which took 330,000 tons of metals in 1958, will "consume" less than 25 per cent that much this year. It appears that output will either have to be cut back or stocks will build up to high levels.

• **Lead**—The continued depressed state of lead is illustrated by two

recent developments: 1. The price was cut 0.5 cent to 11 cents a pound on Feb. 24. It marks the third drop since the first of the year when the metal was selling for 13 cents a pound. 2. The nation's top producer, St. Joseph Lead Co., cut all

its mining and milling operations to a four day workweek.

Last year, U. S. mines produced 266,000 tons of recoverable lead, the lowest annual output since 1899. Producers were encouraged by a sharp sales uptrend in the fall and stepped up operations. But the pace has not been maintained in 1959. The situation is causing a return to the 1958 operating rate.

Look for more price weakness unless demand picks up.

• **Zinc**—A day after the lead price dropped, a leading custom smelter caught the trade by surprise with a similar reduction in zinc to 11 cents a pound. Reason: A dip in demand with a resultant buildup in stocks.

Sales continued to slump throughout February. The two chief consumers, diecasters and galvanizers, have been taking less metal. However, producers expect a rebound as last year's fourth quarter inventories are worked off.

Magnesium Takes to Space

The Vanguard weather satellite now circling the earth has a skin, internal framework, and an instrument can fabricated entirely from magnesium. Out of its total weight of 21 lb, 5 lb are magnesium; the rest is instrument payload.

Three other Vanguard satellites fabricated from magnesium are scheduled to be shot into orbit this year: 1. One to study the earth's magnetism. 2. One to study cosmic rays. 3. A more complicated weather satellite that weighs 50 lb.

NONFERROUS PRICE RECORD

	Price Feb. 25	Last Change	Previous Price	Jan. Avg	Dec., 1958 Avg	Feb., 1958 Avg
Aluminum	24.70	Aug. 1, 1958	24.00	24.700	24.700	26.000

New York; NICKEL, electrolytic cathodes, 99.9%, base size at refinery, unpacked; ALUMINUM, primary pig, 99.5+%, f.o.b. shipping point; MAGNESIUM, pig, 99.8%, Velasco, Tex.

LOW-COST WAY to Quieter Gears

Finishing power transmission gears to tolerances measured in "tenths" used to be costly. But not any more: they can now be ground on the No. 12 Fellows-Reishauer Gear Grinding Machine which combines low-cost, high-speed operation with outstanding accuracy. As a result, these heavy-duty industrial mixers now run more smoothly and efficiently than was ever possible before.

The Fellows-Reishauer is built in America by Fellows, under a license from Switzerland's Reishauer Tool Works, Ltd. Fast and simple to set up, it permits economical grinding of single gears as well as long production runs. Capacities are 12" outside diameter for both spur and helical gears; 6¾" face width for spurs. Max. face width for

helicals depends on pitch and helix angle.

Fellows gear production and inspection equipment can probably help you lower your gear production costs, whatever your requirements.

The complete line, for gears from 1/16" to 120" P.D., includes Fellows Gear Shapers, Pfauter Gear Hobbers and Fellows-Reishauer Gear Grinders as well as a number of other more specialized machines. For full information, get in touch with any Fellows office.

THE FELLOWS GEAR SHAPER COMPANY
78 River Street, Springfield, Vermont

Branch Offices:

1048 North Woodward Ave., Royal Oak, Mich.
150 West Pleasant Avenue, Maywood, N. J.
5835 West North Avenue, Chicago 39
6214 West Manchester Ave., Los Angeles 45

Gears for a well-known line of industrial mixers are ground to runout tolerance of 0.0005" T.I.R. at high speed and low cost.

PRIMARY METALS AND ALLOYS

Aluminum: 99.5%, pigs, 24.70; ingots, 26.80, 30,000 lb or more, f.o.b. shipping point. Freight allowed on 500 lb or more.

Aluminum Alloy: No. 13, 28.60; No. 43, 28.40; No. 195, 29.40; No. 214, 30.20; No. 356, 28.60; 30 or 40 lb ingots.

Antimony: R.M.M. brand, 99.5%, 29.00; Lone Star brand, 29.50, f.o.b. Laredo, Tex., in bulk. Foreign brands, 99.5%, 24.50-25.00, New York, duty paid, 10,000 lb or more.

Beryllium: 97% lump or beads, \$71.50 per lb, f.o.b. Cleveland or Reading, Pa.

Beryllium Aluminum: 5% Be, \$74.75 per lb of contained Be, with balance as Al at market price, f.o.b. shipping point.

Beryllium Copper: 3.75-4.75% Be, \$43 per lb of contained Be, with balance as Cu at market price on shipment date, f.o.b. shipping point.

Bismuth: \$2.25 per lb, ton lots.

Cadmium: Sticks and bars, \$1.45 per lb deld. Cobalt: 97.99%, \$1.75 per lb for 500-lb keg; \$1.77 per lb for 100 lb case; \$1.82 per lb under 100 lb.

Columbium: Powder, \$55-85 per lb, nom.

Copper: Electrolytic, 30.00 deld.; custom smelters, 31.00; lake, 30.00 deld.; fire refined, 29.75 deld.

Germanium: First reduction, \$179.17-197.31 per lb; intrinsic grade, \$197.31-220 per lb, depending on quantity.

Gold: U. S. Treasury, \$35 per oz.

Indium: 99.9%, \$2.25 per troy oz.

Iridium: \$75-80 nom. per troy oz.

Lead: Common, 10.80; chemical, 10.90; cor-rod, 10.90, St. Louis. New York basis, add 0.20.

Lithium: 98 + %, 50-100 lb, cups or ingots, \$12; rod, \$15; shot or wire, \$16. 100-500 lb, cups or ingots, \$10.50; rod, \$14; shot or wire, \$15, f.o.b. Minneapolis.

Magnesium: Pig, 35.25; ingot, 36.00 f.o.b. Velasco, Tex.; 12 in. sticks, 59.00 f.o.b. Madison, Ill.

Magnesium Alloys: AZ91A (diecasting), 40.75 deld.; AZ63A, AZ92A, 9291C (sand casting), 40.75, f.o.b. Velasco, Tex.

Mercury: Open market, spot, New York, \$218-221 per 76 lb flask.

Molybdenum: Unalloyed, turned extrusion, 3.75-5.75 in. round, \$9.60 per lb in lots of 2500 lb or more, f.o.b. Detroit.

Nickel: Electrolytic cathodes, sheets (4 x 4 in. and larger), unpacked, 74.00; 10-lb pigs, unpacked, 78.25; "XX" nickel shot, 79.50; "F" nickel shot for addition to cast iron, 74.50; "F" nickel, 5 lb ingots in kegs for addition to cast iron, 75.50. Prices f.o.b. Port Colborne, Ont., including import duty. New York basis, add 1.01. Nickel oxide sinter at Buffalo, New York, or other established U. S. points of entry, contained nickel, 69.60.

Osmium: \$70-100 per troy oz nom.

Palladium: \$16-18 per troy oz.

Platinum: \$67-70 per troy oz from refineries.

Radium: \$16-21.50 per mg radium content, depending on quantity.

Rhodium: \$122-125 per troy oz.

Ruthenium: \$55-60 per troy oz.

Selenium: \$7.00 per lb, commercial grade.

Silver: Open market, 90.625 per troy oz.

Sodium: 17.00 c.l.; 19.00-19.50 l.c.l.

Tantalum: Rod, \$60 per lb; sheet, \$55 per lb.

Tellurium: \$1.65-1.85 per lb.

Thallium: \$7.50 per lb.

Tin: Straits, N. Y. spot and prompt, 104.75.

Titanium: Sponge, 99.3 + % grade A-1, ductile (0.3% Fe max.), \$1.62-1.82; grade A-2 (0.5% Fe max.), \$1.70 per lb.

Tungsten: Powder, 98.8%, carbon reduced, 1000-lb lots, \$2.75-2.90 per lb nom., f.o.b. shipping point; less than 1000 lb, add 15.00; 99 + % hydrogen reduced, \$3.30-3.80.

Zinc: Prime Western, 11.00; brass special, 11.25; intermediate, 11.50, East St. Louis, freight allowed over 0.50 per lb. New York basis, add 0.50. High grade, 12.00; special high grade, 12.25 deld. Diecasting alloy ingot No. 3, 13.50; No. 2, 13.75; No. 5, 14.00 deld.

Zirconium: Reactor grade sponge, 100 lb or less, \$7 per lb; 100-500 lb, \$6.50 per lb; over 500 lb, \$6 per lb.

(Note: Chromium, manganese, and silicon metals are listed in ferroalloy section.)

SECONDARY METALS AND ALLOYS

Aluminum Ingot: Piston alloys, 23.875-25.25; No. 12 foundry alloy (No. 2 grade), 21.75-22.00; 5% silicon alloy, 0.60 Cu max., 24.75-25.00; 13 alloy, 0.60 Cu max., 24.75-25.00; 195 alloy, 25.25-26.00; 108 alloy, 22.25-22.50. Steel deoxidizing grades, notch bars, granulated or shot: Grade 1, 23.50; grade 2, 22.00; grade 3, 21.00; grade 4, 19.00.

Brass Ingot: Red brass, No. 115, 30.00; tin bronze, No. 225, 40.50; No. 245, 34.25; high-leaded tin bronze, No. 305, 34.25; No. 1 yellow, No. 405, 24.50; manganese bronze, No. 421, 26.75.

Magnesium Alloy Ingot: AZ63A, 37.50; AZ91B, 37.50; AZ91C, 41.25; AZ92A, 37.50.

NONFERROUS PRODUCTS

BERYLLIUM COPPER

(Base prices per lb, plus mill extras, 2000 to 5000 lb; nom. 1.9% Be alloy.) Strip, \$1.895, f.o.b. Temple, Pa., or Reading, Pa.; rod, bar, wire, \$1.875, f.o.b. Temple, Pa.

COPPER WIRE

Bare, soft, f.o.b. eastern mills, 20,000-lb lots, 35.35; l.c.l., 35.98. Weatherproof, 20,000-lb lots, 36.29; l.c.l., 37.04.

LEAD

(Prices to jobbers, f.o.b. Buffalo, Cleveland, Pittsburgh.) Sheets, full rolls, 140 sq ft or more, \$16.50 per cwt; pipe, full coils, \$16.50 per cwt; traps and bends, list prices plus 30%.

TITANIUM

(Prices per lb, 10,000 lb and over, f.o.b. mill.) Sheet and strip, \$7.50-17.00; sheared mill plate, \$5.25-10.00; wire, \$5.75-10.00; forging billets, \$3.55-5.75; hot-rolled and forged bars, \$4.25-7.50.

ZINC

(Prices per lb, c.l., f.o.b. mill.) Sheets, 26.00; ribbon zinc in coils, 21.50; plates, 20.00.

ZIRCONIUM

Plate, \$12.50-19.20; H.R. strip, \$12.50-22.90; C.R. strip, \$15.90-31.25; forged or H.R. bars, \$11.00-17.40.

NONFERROUS SCRAP

DEALERS' BUYING PRICES

(Cents per pound, New York, in ton lots.)

Copper and Brass: No. 1 heavy copper and wire, 25.00-26.00; No. 2 heavy copper and wire, 23.00-24.00; light copper, 20.75-21.25; No. 1 composition red brass, 18.75-19.25; No. 1 com-

position turnings, 17.75-18.25; new brass clip-pings, 16.50-17.00; light brass, 12.50-13.00; heavy yellow brass, 13.50-14.00; new brass rod ends, 14.50-15.00; auto radiators, unsweated, 14.50-15.00; cocks and faucets, 15.00-15.50; brass pipe, 15.25-15.75.

Lead: Heavy, 6.50-6.75; battery plates, 2.00; linotype and stereotype, 8.50-9.00; electrotypes, 7.00-7.50; mixed babbit, 9.25-9.75.

Monel: Clippings, 28.50-29.50; old sheets, 25.00-26.00; turnings, 20.00-23.00; rods, 28.00-29.00.

Nickel: Sheets and clips, 52.00-54.00; rolled anodes, 52.00-54.00; turnings, 38.00-40.00; rod ends, 52.00-54.00.

Zinc: Old zinc, 3.50-3.75; new diecast scrap, 3.25-3.50; old diecast scrap, 2.00-2.25.

Aluminum: Old castings and sheets, 9.75-10.25; clean borings and turnings, 6.25-6.75; segregated low copper clips, 13.00-13.50; segregated high copper clips, 13.00-13.50; mixed low copper clips, 12.00-12.50; mixed high copper clips, 11.00-11.50.

(Cents per pound, Chicago)

Aluminum: Old castings and sheets, 11.75-12.25; clean borings and turnings, 9.50-10.00; segregated low copper clips, 16.50-17.00; segregated high copper clips, 15.50-16.00; mixed low copper clips, 15.75-16.25; mixed high copper clips, 15.00-15.50.

(Cents per pound, Cleveland)

Aluminum: Old castings and sheets, 10.00-10.50; clean borings and turnings, 9.00-9.50; segregated low copper clips, 14.00-14.50; segregated high copper clips, 12.50-13.00; mixed low copper clips, 13.00-13.50; mixed high copper clips, 12.00-12.50.

REFINERS' BUYING PRICES

(Cents per pound, carlots, delivered refinery)

Beryllium Copper: Heavy scrap, 0.020-in. and heavier, not less than 1.5% Be, 56.00; light scrap, 51.00; turnings and borings, 35.00.

Copper and Brass: No. 1 heavy copper and wire, 27.50; No. 2 heavy copper and wire, 25.75; light copper, 23.50; refinery brass (60% copper) per dry copper content, 25.00.

INGOTMAKERS' BUYING PRICES

Copper and Brass: No. 1 heavy copper and wire, 27.50; No. 2 heavy copper and wire, 25.75; light copper, 23.50; No. 1 composition borings, 21.50; No. 1 composition solids, 22.00; heavy yellow brass solids, 15.50; yellow brass turnings, 14.50; radiators, 17.00.

PLATING MATERIALS

(F.o.b. shipping point, freight allowed on quantities)

ANODES

Cadmium: Special or patented shapes, \$1.45. **Copper:** Flat-rolled, 46.29; oval, 44.50 5000-10,000 lb; electrodeposited, 39.50, 2000-5000 lb lots; cast, 42.00, 5000-10,000 lb quantities. **Nickel:** Depolarized, less than 100 lb, 114.25; 100-499 lb, 112.00; 500-4999 lb, 107.50; 5000-29,999 lb, 105.25; 30,000 lb, 103.00. Carbonized, deduct 3 cents a lb.

Tin: Bar or slab, less than 200 lb, 122.50; 200-499 lb, 121.00; 500-999 lb, 120.50; 1000 lb or more, 120.00.

Zinc: Balls, 18.00; flat tops, 18.00; flats, 20.75; ovals, 20.00, ton lots.

CHEMICALS

Cadmium Oxide: \$1.45 per lb in 100-lb drums. **Chromic Acid (flake):** 100-2000 lb, 31.00; 2000-10,000 lb, 30.50; 10,000-20,000 lb, 30.00; 20,000 lb or more, 29.50.

Copper Cyanide: 100-200 lb, 65.90; 300-900 lb, 63.00; 1000-19,900 lb, 61.90.

Copper Sulphate: 100-1900 lb, 15.65; 2000-5900 lb, 13.65; 6000-11,900 lb, 13.40; 12,000-22,900 lb, 13.15; 23,000 lb or more, 11.90.

Nickel Chloride: 100 lb, 45.00; 200 lb, 43.00; 300 lb, 42.00; 400-4900 lb, 40.00; 5000-9900 lb, 38.00; 10,000 lb or more, 37.00.

Nickel Sulphate: 5000-22,999 lb, 29.00; 23,000-39,999 lb, 28.50; 40,000 lb or more, 28.00.

Sodium Cyanide (Cyanobrik): 200 lb, 20.80; 400-800 lb, 19.80; 1000-19,900 lb, 18.80; 20,000 lb or more, 17.80.

Sodium Stannate: Less than 100 lb, 80.60; 100-600 lb, 71.20; 700-1900 lb, 63.40; 2000-9900 lb, 66.60; 10,000 lb or more, 65.20.

Stannous Chloride (Anhydrous): 25 lb, 156.20; 100 lb, 151.40; 400 lb, 148.90; 800-19,900 lb, 108.00; 20,000 lb or more, 102.00.

Stannous Sulphate: Less than 50 lb, 141.30; 50 lb, 111.30; 100-1900 lb, 109.30; 2000 lb or more, 107.30.

Zinc Cyanide: 100-200 lb, 59.00; 300-900 lb, 57.00.

Bethlehem Pacific Coast Steel Corp., Seattle.
190 tons, including 105 tons of concrete reinforcing bars, 295 ft steel bridge, Falmouth, Maine, to Bancroft & Martin Rolling Mills Co., South Portland, Maine; W. H. Hinman Inc., Westbrook, Maine, general contractor.
110 tons, powerhouse, state hospital, Bronx, N. Y., through Braberman Construction Co. Inc., Brooklyn, N. Y., to Elizabeth Iron Works, Union, N. J.
105 tons, state highway bridge, Vernon, Conn., to McDermott Steel Specialties Co., Hartford, Conn.; Della-Bitta-Basola Inc., Milldale, Conn., general contractor.

STRUCTURAL STEEL PENDING

5000 tons, cantilever superstructure, Port Mann bridge, Fraser River, British Columbia; bids expected to be called within 90 days; plans by C.B.A. Engineers Ltd., Vancouver, B. C.

1025 tons, gates, fishway, ladders, etc., Ice Harbor Dam, Snake River; bids to U. S. Engineer, Walla Walla, Wash., about Apr. 30.

1000 tons, state expressway, Queens, N. Y.; bids closed.

900 tons, switchyard structures, Lewiston, N. Y., Niagara power project, bids March 5 to the Power Authority of the State of New York.

700 tons, second Lake Washington floating bridge, Seattle; bids to Olympia, Wash., advanced to Mar. 24.

513 tons, state bridgework, Essex County, N. J., bids March 12; also, 111 tons of reinforcing steel required.

430 tons, bridge, Woonsocket, R. I.; Consolidated Constructors Inc., Attleboro, Mass., general contractor.

400 tons, state bridgework, Chemung County, N. Y.; bids closed.
